Simulating Human Origins and Evolution K. P. Wessen, 2005-04-14 The development of populations over time and on longer timescales the evolution of species are both influenced by a complex of interacting underlying processes Computer simulation provides a means of experimenting within an idealised framework to allow aspects of these processes and their interactions to be isolated controlled and understood In this book computer simulation is used to model migration extinction fossilisation interbreeding selection and non hereditary effects in the context of human populations and the observed distribution of fossil and current hominoid species The simulations described enable the visualisation and study of lineages genetic diversity in populations character diversity across species and the accuracy of reconstructions allowing insights into human evolution and the origins of humankind for graduate students and researchers in the fields of physical anthropology human evolution and human genetics

Ghostly Muscles, Wrinkled Brains, Heresies and Hobbits Charles E. Oxnard, 2008 The Leverhulme Trust UK required Charles Oxnard to present a series of public lectures during his tenure of a Leverhulme Professorship at University College London The lectures had to be understandable not only to undergraduate and graduate students and colleagues but also to the interested lay public Furthermore they were expected to meet and venture beyond present day thought in the subject This near impossible task is reproduced in this unique volume Each chapter shows what is rarely if ever done in scientific papers how the problems truly arose how the methods came about the curious collaborators involved the twists and turns of thought involved in the stories the solutions that have so far appeared and the surprising new ideas that stem from the work In particular the part played by serendipity becomes ever more evident Research is very often a kind of Alice in Wonderland task and both students and the public alike are fascinated by the inside stories of how discoveries are really made It is precisely this excitement and complexity that is presented in this book

Bibliographic Index, 2009 *Handbook of Human Molecular Evolution, 2 Volume Set* David N. Cooper, Hildegard Kehrer-Sawatzki, 2008-10-13 This splendid compendium will be the standard reference work for years to come a handbook to browse to consult to look things up in and to read with pleasure wonder and post Darwinian exhilaration

Richard Dawkins This is a marvellous book It should be in every university library preferably in several copies and every reader of this journal should add it to their next grant application It really is that good I have already found this book to be invaluable For many years to come these two volumes will be the starting point for anyone wishing to find out about virtually any subject relating to human genetics Any scientist working on humans or other animals will find many things in these pages that will stimulate inform and inspire The authors editors and publishers are to be congratulated for their work order a copy now HUMAN GENETICS The publishers and editors deserve to be congratulated for publishing this major book which coincides with the 200th anniversary of the birth of Charles Darwin The book is well timed with biologists theologians and sociologists engaged in intense debate on the Darwinian Theory on the origin of species evolution and natural selection There is little doubt that this marvellous publication should be in the library of universities and academic institutions dealing with basic and applied biology research and education It will not be surprising if the individual academic or researcher decides to invest in this resource and enrich their personal collection of leading books in genetics and genomics GENOMIC MEDICINE A Unique Collection of High Quality Articles Derived from the Acclaimed Encyclopedia of Life Sciences The revolution in human molecular genetics which has taken place over the last three decades has yielded a wealth of information not only on the structure and function of our genes but also on gene expression mutation and polymorphic variation Over the last five years the focus has moved from genes to genomes Even though the annotation of our 30 000 genes is still in progress genome wide studies have already yielded abundant evidence for the signatures of past selection and adaptive evolution within human gene sequences Further the completion of the sequencing of the 3 billion base pair human genome coupled with the increasing availability of other vertebrate genome sequences has ushered in a new era of comparative genomics We are now able to identify many of the molecular events from the chromosomal level down to the single base pair that have occurred during vertebrate mammalian primate and hominid evolution Indeed the detailed comparison of the human and chimpanzee genomes has begun to reveal some of the genetic changes that have been involved in the development of human lineage specific traits We are thus acquiring the ability to ask searching questions about our origins about the demographic processes associated with the global radiation of humankind as well as some of the unique adaptations that make us human Evolutionary biology has become so broad that its impact may be felt across the spectrum of the biological sciences The aim of the Handbook of Human Molecular Evolution is relatively straightforward to bring together under the same cover the many and varied strands of our knowledge of human primate vertebrate molecular evolution Hence the 282 chapters that comprise this essential reference work have been thematically arranged into twelve sections covering the whole scope of research into human molecular evolution General Concepts in Evolutionary Genetics Mutation Adaptation and Natural Selection Evolutionary and Population Genetics Human Evolution Human Genome Evolution Evolution of Human Gene Structure and Function Evolution of Gene Expression Mitochondrial Genome Evolution Chromosomal Evolution Comparative

Genomics Evolution and Disease Susceptibility Analysis of Ancient DNA This conceptual outline informed the selection of the chapters themselves and the connections between them Some of these chapters are intended to be introductory aimed at undergraduates and non specialists They provide basic information and a list of recommended further reading to encourage the reader to explore a topic in more depth This approach helps the student reader progress from textbook material to primary literature Some chapters are overviews that address topics of broad interest and importance while others focus on quite specialized topics These chapters are written for postgraduate students and research workers they contain more detailed information and key references allowing the reader to investigate a specific area in more depth This format allows professionals to use the books as a quick reference source The chapters are richly supplied with website information to allow access to relevant data sources over the internet The self contained peer reviewed articles in this unique handbook have been written by leading scientists in each field Key topics include the evolution of enzyme function the use of nucleic acid divergence as a molecular clock the origin of non functional or junk DNA the role of gene duplication in the emergence of novel gene function and the identification of molecular changes responsible for various human characteristics especially those pertaining to infection cognition disease and disease susceptibility The Handbook of Human Molecular Evolution has adopted an integrated approach to the study of human evolution and seeks throughout to emphasize the interplay between molecular genetic concepts and principles on the one hand and information acquisition and interpretation on the other In this way it is hoped that the documents of evolutionary history written into the fabric of our genome will become accessible to the widest possible audience

Simulating the Evolution of Language Angelo Cangelosi, Domenico Parisi, 2002 This book is the first to provide a comprehensive survey of the computational models and methodologies used for studying the evolution and origin of language and communication Comprising contributions from the most influential figures in the field it presents and summarises the state of the art in computational approaches to language evolution and highlights new lines of development Essential reading for researchers and students in the fields of evolutionary and adaptive systems language evolution modelling and linguistics it will also be of interest to researchers working on applications of neural networks to language problems Furthermore due to the fact that language evolution models use multi agent methodologies it will also be of great interest to computer scientists working on multi agent systems robotics and internet agents

GIS Simulation of the Earliest Hominid Colonisation of Eurasia Kathryn Holmes, 2007 This book aims to shed light on the Out of Africa problem by approaching it from a different angle and proposing when during the Late Pliocene and Early Pleistocene hominid migration was most feasible and along what pathways the migrations may have occurred It represents the first use of GIS to predict and model the potential migration pathways
