Single and Multi-Carrier DS-CDMA Lajos L. Hanzo, L-L. Yang, E-L. Kuan, K. Yen, 2003-09-26 This volume is dedicated to a range of CDMA and MC CDMA transmission aspects of systems designed for communicating over fading wireless channels. Currently a technical in depth book on this subject which has a similar detailed exposure of the recent advances in CDMA. Many CDMA and MC CDMA is unavailable. A further attraction of the joint treatment of these topics is that it allows the reader to view their design trade offs in a comparative context. Divided into five main parts. Part I provides a detailed introduction to the subject of CDMA systems designed for employment in various applications. Part II deals with the currently hot topic of genetic algorithm assisted multiuser detection. Part III gives a detailed account of new reduced complexity many CDMA schemes. Part IV considers a range of novel MC CDMA schemes which have the potential of supporting numerous design objectives. Part V provides an overview of the 3G wireless system proposals and characterises the expected network capacity gains attained with the aid of adaptive CDMA systems. By providing an all encompassing self contained treatment this groundbreaking volume will have appeal to researchers, postgraduate students, academics practising research and development engineers working for wireless communications and computer networking companies as well as senior undergraduate students and technical managers in the field.

Multi-user Detection for Multi-rate DS/CDMA Systems Jinwen Ma,2000 Wireless cellular communication is witnessing a rapid growth in market technology and range of services Current and future demands for wireless communication services motivate the need for handling multi media traffic types In a multimedia communication system users with different and even time varying rates and quality of services QoS requirements such as voice image and data must be accommodated The use of Spread Spectrum modulation with Code Division Multiple Access CDMA technology is an attractive approach for economical spectrally efficient and high quality cellular and personal communication services This dissertation explores the technologies of applying different interference cancellation techniques to multi rate CDMA systems that serve users with different QoS Multiple Access Interference MAI and multipath propagation are the major issues in wireless communication systems It is also true for multi rate CDMA systems Multi user detection has been shown to be effective in combating the near far problem and providing superior performance over conventional detection method In this dissertation we combine both linear minimum mean squared error LMMSE detector nonlinear decision feedback detector with other signal processing techniques such as array processing and multipath combining to create effective near far resistant detectors for multi rate CDMA systems Firstly we propose MMSE receivers for synchronous multi rate CDMA system and compare the performance with the corresponding multi rate decorrelating detectors The multi rate decorrelating detector is optimally near far resistant and easy to implement The proposed linear MMSE multi rate receiver can be adaptively implemented only with the knowledge of

the desired user Due to the fact that MMSE detector offers best trade off between the MAI cancellation and noise variance enhancement it is shown that multi rate MMSE receiver can offer better performance than the multi rate decorrelator when the interfering users Signal to Noise Ratio SNR is relatively low comparing to the desired user s SNR Secondly the asynchronous multi rate CDMA system we propose multi rate multi shot decorrelating detectors and multi rate multi shot MMSE detectors The performance of multi shot detectors can be improved monotonically with increasing the number of stacked bits but a great computational complexity is going to be introduced in order to get better performance A debiasing method is introduced to multi rate multi shot linear detectors Debiasing method optimizes multi rate detectors based on the multi rate multi shot model Debiasing multi shot MMSE detector for multi rate signals can offer performance than the corresponding debiasing multi shot decorrelating detector Thirdly we propose linear space time receivers for multi rate CDMA systems The minimum mean squared error criteria is used We perform a comparative study on the multi rate receiver which uses either multipath temporal processing or array spatial processing and the one which uses both array and multipath space time processing The space time receiver for the multi rate CDMA signals give us the potential of improving the capacity of multi rate systems The space time processing combined with multiuser detection have the advantages of combating multipath fading through temporal processing reducing MAI through MMSE method and provide antenna or diversity gain through spatial processing and increasing the capacity of the multi rate CDMA systems Lastly the group wise interference cancellation methods are proposed for multi rate CDMA signals The non linear decision feedback detection DFD schemes are used in the proposed receivers The proposed interference cancellation schemes benefit from the nature of the unequal received amplitudes for multi rate CDMA signals Users with same data rate are grouped together Users with the highest data rate are detected first Interference between the groups is cancelled in a successive order The results show that the group wise MMSE DFD yields better performance than multi rate linear MMSE detector and multi rate decorrelating detector especially for highly loaded CDMA systems

Paulo Silva,Rui Dinis,2022-09-01 Future broadband wireless communication systems are expected to be able to offer new and powerful services enabling fast transmission rates of several tens of Mbit s This is an ambitious challenge especially for mobile communication systems since these systems should be able to cope with severely time dispersive channels associated to the signal multipath propagation Moreover these systems should have high spectral and power efficiencies as well as high capacity and flexibility Spread spectrum techniques particularly coded division multiple access CDMA techniques allow high capacity and flexibility continuous transmission requiring low peak power requirements for the amplifiers as well as some robustness against fading and time dispersion effects associated with the multipath propagation When employed in prefix assisted PA block transmission schemes combined with frequency domain receiver implementations they become especially

interesting for broadband wireless systems In Frequency Domain Multiuser Detection for CDMA Systems the use of PA block transmission is considered in the context of both DS Direct Sequence and MC Multicarrier CDMA schemes The main goal is the study of frequency domain multiuser detection techniques with iterative signal detection decoding techniques also in combination with estimation and cancelation of nonlinear distortion effects The receiver structures are suitable to scenarios with high interference levels and strongly time dispersive channels *Index to IEEE Publications* Institute of Electrical and Electronics Engineers, 1989 Issues for 1973 cover the entire IEEE technical literature
