Introduction To Matrix Theory: With Applications To Business And Economics Sandor Molnar, Ferenc Szidarovszky, 2002-05-30 In economic modeling and planning as well as in business most problems are linear or approximated by linear models Such problems are solved by matrix methods so the material presented in this book is essential to these fields

Linear-Fractional Programming Theory, Methods, Applications and Software E.B. Bajalinov, 2013-12-01 This is a book on Linear Fractional Programming here and in what follows we will refer to it as LFP The field of LFP largely developed by Hungarian mathematician B Martos and his associates in the 1960 s is concerned with problems of optimization LFP problems deal with determining the best possible allocation of available resources to meet certain specifications In particular they may deal with situations where a number of resources such as people materials machines and land are available and are to be combined to yield several products In linear fractional programming the goal is to determine a permissible allocation of resources that will maximize or minimize some specific showing such as profit gained per unit of cost or cost of unit of product produced etc Strictly speaking linear fractional programming is a special case of the broader field of Mathematical Programming LFP deals with that class of mathematical programming problems in which the relations among the variables are linear the constraint relations i e the restrictions must be in linear form and the function to be optimized i e the objective function must be a ratio of two linear functions

Time Delay Systems: Methods, Applications and New Trends Rifat

Sipahi, Tomas Vyhlídal, Silviu-Iulian Niculescu, Pierdomenico Pepe, 2012-02-24 This volume is concerned with the control and dynamics of time delay systems a research field with at least six decade long history that has been very active especially in the past two decades In parallel to the new challenges emerging from engineering physics mathematics and economics the volume covers several new directions including topology induced stability large scale interconnected systems roles of networks in stability and new trends in predictor based control and consensus dynamics The associated applications problems are described by highly complex models and require solving inverse problems as well as the development of new theories mathematical tools numerically tractable algorithms for real time control The volume which is targeted to present these developments in this rapidly evolving field captures a careful selection of the most recent papers contributed by experts and collected under five parts i Methodology From Retarded to Neutral Continuous Delay Models ii Systems Signals and Applications iii Numerical Methods iv Predictor based Control and Compensation and v Networked Control Systems and Multi agent Systems

Matrices Denis Serre, 2007-12-18 In this book Denis Serre begins by providing a clean and concise introduction to the basic theory of matrices He then goes on to give many interesting applications of matrices to different aspects of mathematics and also other areas of science and engineering The book mixes together algebra analysis complexity theory and numerical analysis As such this book will provide many scientists not just mathematicians with a useful and reliable reference It is intended for advanced undergraduate and graduate students with either applied or theoretical goals This book is based on a course given by the author at the Ecole Normale Sup rieur de Lyon *Basic Matrix Analysis and Synthesis, with Applications to Electronic Engineering* G. Zelinger, 1966

Matrix Algebra James E. Gentle, 2007-08-06 Matrix algebra is one of the most important areas of mathematics for data analysis and for statistical theory The first part of this book presents the relevant aspects of the theory of matrix algebra for applications in statistics This part begins with the fundamental concepts of vectors and vector spaces next covers the basic algebraic properties of matrices then describes the analytic properties of vectors and matrices in the multivariate calculus and finally discusses operations on matrices in solutions of linear systems and in eigenanalysis This part is essentially self contained The second part of the book begins with a consideration of various types of matrices encountered in statistics such as projection matrices and positive definite matrices and describes the special properties of those matrices The second part also describes some of the many applications of matrix theory in statistics including linear models multivariate analysis and stochastic processes The brief coverage in this part illustrates the matrix theory developed in the first part of the book The first two parts of the book can be used as the text for a course in matrix algebra for statistics students or as a supplementary text for various courses in linear models or multivariate statistics The third part of this book covers numerical linear algebra It begins with a discussion of the basics of numerical computations and then describes accurate and efficient algorithms for factoring matrices solving linear systems of equations and extracting eigenvalues and eigenvectors Although the book is not tied to any particular software system it

describes and gives examples of the use of modern computer software for numerical linear algebra This part is essentially self contained although it assumes some ability to program in Fortran or C and or the ability to use R S Plus or Matlab This part of the book can be used as the text for a course in statistical computing or as a supplementary text for various courses that emphasize computations The book includes a large number of exercises with some solutions provided in an appendix
