Mathematical Modeling And Methods Of Option Pricing:

Mathematical Modeling and Methods of Option Pricing Lishang Jiang, Canguo Li, 2005 From the perspective of partial differential equations PDE this book introduces the Black Scholes Merton's option pricing theory A unified approach is used to model various types of option pricing as PDE problems to derive pricing formulas as their solutions and to design efficient algorithms from the numerical calculation of PDEs

Mathematical Modeling And Methods Of Option Pricing Lishang Jiang, 2005-07-18 From the unique perspective of partial differential equations PDE this self contained book presents a systematic advanced introduction to the Black Scholes Merton's option pricing theory A unified approach is used to model various types of option pricing as PDE problems to derive pricing formulas as their solutions and to design efficient algorithms from the numerical calculation of PDEs In particular the qualitative and quantitative analysis of American option pricing is treated based on free boundary problems and the implied volatility as an inverse problem is solved in the optimal control framework of parabolic equations

Computational Probability and Mathematical Modeling José Roberto Cantú-González,F-Javier Almaguer,Javier Morales-Castillo,Pavel Solin,2019-12-24 In the present time two of the most important approaches to tackle complex systems are probability and stochastic processes theory Still from an analytic perspective modeling and solving a problem using a stochastic approach is not a trivial issue hence a combination of the logic of probabilistic reasoning with computational science is needed to obtain qualitatively good solutions in a reasonable time This eBook presents an interesting view of applications associated to fields of probability statistics and mathematic modeling all of them supported by a computational context though the approach of stochasticity and simulation used in most of them This collection contains three chapters which bring applications in fields of biology finance and physics each chapter contains work s with specific applications An editorial is also contained with a summarized version of each work and each of them are widely explained in a specific section which include a state of art to support the nature of the individual research a methodology to solve the defined problem and the results and conclusions We hope the present eBook can represent a potential source of knowledge for the academic community of implicated disciplines and an inspirational starting point of starting for scientists in the amazing world of applied mathematics and the search to solve complex problems **Exotic Option Pricing and Advanced Lévy**

Models Andreas Kyprianou,Wim Schoutens,Paul Wilmott,2006-06-14 Since around the turn of the millennium there has been a general acceptance that one of the more practical improvements one may make in the light of the shortfalls of the classical Black Scholes model is to replace the underlying source of randomness a Brownian motion by a Lévy process Working with Lévy processes allows one to capture desirable distributional characteristics in the stock returns In addition recent work on Lévy processes has led to the understanding of many probabilistic and analytical properties which make the processes attractive as mathematical tools At the same time exotic derivatives are gaining increasing importance as financial instruments and are traded nowadays in large quantities in OTC markets The current volume is a compendium of chapters each of which consists of discursive review and recent research on the topic of exotic option pricing and advanced Lévy markets written by leading scientists in this field In recent years Lévy processes have leapt to the fore as a tractable mechanism for modeling asset returns Exotic option values are especially sensitive to an accurate portrayal of these dynamics This comprehensive volume provides a valuable service for financial researchers everywhere by assembling key contributions from the world s leading researchers in the field Peter Carr Head of Quantitative Finance Bloomberg LP This book provides a front row seat to the hottest new field in modern finance options pricing in turbulent markets The old models

have failed as many a professional investor can sadly attest So many of the brightest minds in mathematical finance across the globe are now in search of new more accurate models Here in one volume is a comprehensive selection of this cutting edge research Richard L Hudson former Managing Editor of The Wall Street Journal Europe and co author with Benoit B Mandelbrot of The Mis Behaviour of Markets A Fractal View of Risk Ruin and Reward *Pricing Derivatives Under Lévy Models* Andrey Itkin,2017-02-27 This monograph presents a novel numerical approach to solving partial integro differential equations arising in asset pricing models with jumps which greatly exceeds the efficiency of existing approaches The method based on pseudo differential operators and several original contributions to the theory of finite difference schemes is new as applied to the Lévy processes in finance and is herein presented for the first time in a single volume The results within developed in a series of research papers are collected and arranged together with the necessary background material from Lévy processes the modern theory of finite difference schemes the theory of M matrices and EM matrices etc thus forming a self contained work that gives the reader a smooth introduction to the subject For readers with no knowledge of finance a short explanation of the main financial terms and notions used in the book is given in the glossary The latter part of the book demonstrates the efficacy of the method by solving some typical problems encountered in computational finance including structural default models with jumps and local stochastic volatility models with stochastic interest rates and jumps The author also adds extra complexity to the traditional statements of these problems by taking into account jumps in each stochastic component while all jumps are fully correlated and shows how this setting can be efficiently addressed within the framework of the new method Written for non mathematicians this book will appeal to financial engineers and analysts econophysicists and researchers in applied numerical analysis It can also be used as an advance course on modern finite difference methods or computational finance

Tools for Computational Finance Rüdiger U. Seydel,2017-08-17 Computational and numerical methods are used in a number of ways across the field of finance It is the aim of this book to explain how such methods work in financial engineering By concentrating on the field of option pricing a core task of financial engineering and risk analysis this book explores a wide range of computational tools in a coherent and focused manner and will be of use to anyone working in computational finance Starting with an introductory chapter that presents the financial and stochastic background the book goes on to detail computational methods using both stochastic and deterministic approaches Now in its sixth edition Tools for Computational Finance has been significantly revised and contains Several new parts such as a section on extended applications of tree methods including multidimensional trees trinomial trees and the handling of dividends Additional

material in the field of generating normal variates with acceptance rejection methods and on Monte Carlo methods 115 exercises and more than 100 figures many in color Written from the perspective of an applied mathematician all methods are introduced for immediate and straightforward application A learning by calculating approach is adopted throughout this book enabling readers to explore several areas of the financial world Interdisciplinary in nature this book will appeal to advanced undergraduate and graduate students in mathematics engineering and other scientific disciplines as well as professionals in financial engineering

Mathematical Models and Numerical Algorithms for Option Pricing and Optimal Trading

□,2017-01-26 This dissertation Mathematical Models and Numerical Algorithms for Option Pricing and Optimal Trading by Na Song was obtained from The University of Hong Kong Pokfulam Hong Kong and is being sold pursuant to Creative Commons Attribution 3 0 Hong Kong License The content of this dissertation has not been altered in any way We have altered the formatting in order to facilitate the ease of printing and reading of the dissertation All rights not granted by the above license are retained by the author Abstract Research conducted in mathematical finance focuses on the quantitative modeling of financial markets It allows one to solve financial problems by using mathematical methods and provides understanding and prediction of the complicated financial behaviors In this thesis efforts are devoted to derive and extend stochastic optimization models in financial economics and establish practical algorithms for representing and solving problems in mathematical finance An option gives the holder the right but not the obligation to buy or sell an underlying asset at a specified strike price on or before a specified date In this thesis a valuation model for a perpetual convertible bond is developed when the price dynamics of the underlying share are governed by Markovian regime switching models By making use of the relationship between the convertible bond and an American option the valuation of a perpetual convertible bond can be transformed into an optimal stopping problem A novel approach is also proposed to discuss an optimal inventory level of a retail product from a real option perspective in this thesis The expected present value of the net profit from selling the product which is the objective function of the optimal inventory problem can be given by the actuarial value of a real option Hence option pricing techniques are adopted to solve the optimal inventory problem in this thesis The goal of risk management is to eliminate or minimize the level of risk associated with a business operation In the risk measurement literature there is relatively little amount of work focusing on the risk measurement and management of interest rate instruments This thesis concerns about building a risk measurement framework based on some modern risk measures such as Value at Risk VaR and Expected Shortfall ES for describing and quantifying the risk of interest rate sensitive instruments From the lessons of the recent financial turmoils it is understood that maximizing profits is not the only objective that needs to be taken into account The consideration for risk control is of primal importance Hence an optimal submission problem of bid and ask quotes in the presence of risk constraints is studied in this thesis The optimal submission problem of bid and ask quotes is formulated as a stochastic optimal control problem Portfolio management is a professional management of various

securities and assets in order to match investment objectives and balance risk against performance Different choices of time series models for asset price may lead to different portfolio management strategies In this thesis a discrete time dynamic programming approach which is flexible enough to deal with the optimal asset allocation problem under a general stochastic dynamical system is explored It s also interesting to analyze the implications of the heteroscedastic effect described by a continuous time stochastic volatility model for evaluating risk of a cash management problem In this thesis a continuous time dynamic programming approach is employed to investigate the cash management problem under stochastic volatility model and constant volatility model respectively DOI 10 5353 th_b5066216 Subjects Options Finance Prices Mathematical models Options Finance Mathematical models

PDE and Martingale Methods in Option Pricing Andrea Pascucci,2011-04-15 This book offers an introduction to the mathematical probabilistic and numerical methods used in the modern theory of option pricing The text is designed for readers with a basic mathematical background The first part contains a presentation of the arbitrage theory in discrete time In the second part the theories of stochastic calculus and parabolic PDEs are developed in detail and the classical arbitrage theory is analyzed in a Markovian setting by means of of PDEs techniques After the martingale representation theorems and the Girsanov theory have been presented arbitrage pricing is revisited in the martingale theory optics General tools from PDE and martingale theories are also used in the analysis of volatility modeling The book also contains an Introduction to Levy processes and Malliavin calculus The last part is devoted to the description of the numerical methods used in option pricing Monte Carlo binomial trees finite differences and Fourier transform
