Mathematical Theory of Elastic Structures Kang Feng,Zhong-Ci Shi,2013-04-17 Elasticity theory is a classical discipline The mathematical theory of elasticity in mechanics especially the linearized theory is quite mature and is one of the foundations of several engineering sciences In the last twenty years there has been significant progress in several areas closely related to this classical field this applies in particular to the following two areas First progress has been made in numerical methods especially the development of the finite element method The finite element method which was independently created and developed in different ways by sci entists both in China and in the West is a kind of systematic and modern numerical method for solving partial differential equations especially el iptic equations Experience has shown that the finite element method is efficient enough to solve problems in an extremely wide range of applica tions of elastic mechanics In particular the finite element method is very suitable for highly complicated problems One of the authors Feng of this book had the good fortune to participate in the work of creating and establishing the theoretical basis of the finite element method He thought in the early sixties that the method could be used to solve computational problems of solid mechanics by computers Later practice justified and still continues to justify this point of view The authors believe that it is now time to include the finite element method as an important part of the content of a textbook of modern elastic mechanics

Bengt Å Åkesson,1967 The author had a desire to contribute to the advancement of a general theory for the analysis of statically loaded elastic structures with all kinds of nonlinearities permitted The theory should set out from the conception of a structure as an assemblage of a finite number of finite members inter connected in a finite number of loaded joints Particularly the author wished to suggest develop explain and term some new concepts in order to facilitate discussion and classification of nonlinear structure analysis to introduce a compact notation to express nonlinear relations between matrices to find a necessary and sufficient condition for the validity of Maxwell s and Mohr s work theorem to clarify the relation between Maxwell s and Mohr s work theorem and the duality contragredience cotransference of the natural transformations to formulate displacement method solutions for nonlinear structures to examine the consequences of representing the member load by statically dependent components instead of statically independent components to review discuss and classify current methods for the analysis of non linear structures to inquire into the possibility of using matrices with variable elements in nonlinear structure analysis and to peruse and list existing literature on nonlinear structure analysis After deliberation the author has decided to omit figures Figures could illustrate only a few concrete cases and they might spoil the

reader's imagination of the general situation in structure analysis Needed verification is probably best obtained through examples devised by the reader himself
