

Random mappings

- Let F_n denote all functions (mappings) from a finite domain of size n to a finite co-domain of size n
- Every mapping is equally likely to be chosen, $|F_n| = n^n$ the probability of choosing a particular mapping is $1/n^n$
- Example. $f : \{1, 2, \dots, 13\} \rightarrow \{1, 2, \dots, 13\}$

Graphic by Maithili Narasimha

- As n tends to infinity, the following are expectations of some parameters associated with a random point in $\{1, 2, \dots, n\}$ and a random function from F_n : (i) tail length: $\sqrt{(\pi n/8)}$ (ii) cycle length: $\sqrt{(\pi n/8)}$ (iii) rho-length: $\sqrt{(\pi n/2)}$.

Distance Expanding Random Mappings, Thermodynamical Formalism, Gibbs Measures and Fractal Geometry Volker Mayer,Bartłomiej Skorulski,Mariusz Urbanski,2011-10-26 The theory of random dynamical systems originated from stochastic differential equations It is intended to provide a framework and techniques to describe and analyze the evolution of dynamical systems when the input and output data are known only approximately according to some probability distribution The development of this field in both the theory and applications has gone in many directions In this manuscript we introduce measurable expanding random dynamical systems develop the thermodynamical formalism and establish in particular the exponential decay of correlations and analyticity of the expected pressure although the spectral gap property does not hold This theory is then used to investigate fractal properties of conformal random systems We prove a Bowen s formula and develop the multifractal formalism of the Gibbs states Depending on the behavior of the Birkhoff sums of the pressure function we arrive at a natural classification of the systems into two classes quasi deterministic systems which share many properties of deterministic ones and essentially random systems which are rather generic and never bi Lipschitz equivalent to deterministic systems We show that in the essentially random case the Hausdorff measure vanishes which refutes a conjecture by Bogenschutz and Ochs Lastly we present applications of our results to various specific conformal random systems and positively answer a question posed by Bruck and Buger concerning the Hausdorff dimension of quadratic random Julia sets
