Seghier,2015-01-22 Reading is an integral part of life in today s information driven societies Since the pioneering work of Dejerine on word blindness in brain lesioned patients the literature has increased exponentially from neuropsychological case reports to mechanistic accounts of word processing at the behavioural neurofunctional and computational levels tapping into diverse aspects of visual word processing These studies have revealed some exciting findings about visual word processing including how the brain learns to read how changes in literacy impact upon word processing strategies and whether word processing mechanisms vary across different alphabetic logographic or artificial writing systems Other studies have attempted to characterise typical and atypical word processes in special populations in order to explain why dyslexic brains struggle with words how multilingualism changes the way our brains see words and what the exact developmental signatures are that would shape the acquisition of reading skills Exciting new insights have also emerged from recent studies that have investigated word stimuli at the system network level by looking for instance at how the reading system interacts with other cognitive systems in a context dependent fashion how visual language stimuli are integrated into the speech processing streams how both left and right hemispheres cooperate and interact during word processing and what the exact contributions of subcortical and cerebellar regions to reading are The contributions to this Research Topic highlight the latest findings regarding the different issues mentioned above particularly how these findings can explain or model the different processes mechanisms pathways or cognitive strategies by which the human brain sees words The introductory editorial summarising the contributions included here highlights how varieties of behavioural tests and neuroimaging techniques can be used to investigate word processing mechanisms across different alphabetic and logographic writing systems *Cumulative Book Index* ,1998 A world list of books in the English language

Clocking the Mind Arthur R. Jensen,2006-07-10 Mental Chronometry MC comprises a variety of techniques for measuring the speed with which the brain processes information First developed in mid 1800 MC was subsequently eclipsed by more complex and practically useful types of psychometric tests stemming from Alfred Binet This class of mental tests however has no true metric relating the test scores to any specific properties of the brain per se The scores merely represent an ordinal scale only ranking individuals according to their overall performance on a variety of complex mental tasks The resulting scores represent no more than ranks rather than being a true metrical scale of any specific dimension of brain function Such an ordinal scale which merely ranks individuals in some defined population possesses no true scale properties possessing neither a true zero or equal intervals throughout the scale This deficiency obstructs the development of a true

natural science of mental ability The present burgeoning interest in understanding individual differences in mental abilities in terms of the natural sciences biology and the brain sciences in particular demands direct measures that functionally link brain and behavior One such natural ratio scale is time itself the time it takes the brain to perform some elementary cognitive task measured in milliseconds After more than 25 years researching MC Jensen here presents results on an absolute scale showing times for intake of visual and auditory information for accessing short term and long term memory and other cognitive skills as a function of age at yearly intervals from 3 to 80 years The possible uses of MC in neurological diagnosis and the monitoring of drug effects on cognition the chronometric study of special time sensitive talents such as musical performance and presents a theory of general intelligence or g as a function of the rate of oscillation of neural action potentials as measured by chronometric methods Finally Jensen urges the world wide standardization of chronometric methods as necessary for advancing MC as a crucial branch of biopsychological science Provides a different scale to report Mental Chronometry MC findings Argues for the global adoption of an absolute scale as opposed to the traditional ordinal scale An important contribution to MC researchers and psychologists and neuroscientists PC Mag ,1996-05-14 PCMag.com is a leading authority on technology delivering Labs based independent reviews of the latest products and services Our expert industry analysis and practical solutions help you make better buying decisions and get more from technology
