**ABSTRACT:** Coronary artery disease (CAD) is a leading cause of disease burden worldwide. Referral to cardiac rehabilitation (CR) is a class I recommendation for all patients with CAD based on findings that participation can reduce cardiovascular and all-cause mortality, as well as improve functional capacity and quality of life. However, programme uptake remains low, systematic progression through the traditional CR phases is often lacking, and communication between health care providers is frequently suboptimal, resulting in fragmented care. Only 30% to 50% of eligible patients are typically referred to outpatient CR and fewer still complete the programme. In contemporary models of CR, patients are no longer treated by a single practitioner, but rather by an array of health professionals, across multiple specialities and health care settings. The risk of fragmented care in CR may be great, and a concerted approach is required to achieve continuity and optimise patient outcomes. ‘Continuity of care’ has been described as the delivery of services in a coherent, logical, and timely fashion and which entails 3 specific domains: informational, management, and relational continuity. This is examined in the context of CR.

## Introduction

Coronary artery disease (CAD) remains the leading cause of disease burden in Australia and continues to cost the health care system more than 1.3 billion dollars annually.<sup>1</sup> Cardiac rehabilitation (CR) provides a cost-effective therapy<sup>2</sup> that aims to accelerate recovery following an acute event and reduce the risk of recurrent events through structured exercise prescription, education, and risk factor modification.<sup>3</sup> Referral to CR is a class I recommendation for all patients with CAD<sup>1–2</sup> based on a growing body of evidence that participation can reduce hospital bed usage, cardiovascular mortality, as well as improve functional capacity and quality of life.<sup>4</sup> In Australia, the provision of CR is guided by key documents<sup>5,6</sup> which describe an integrated pathway spanning the continuum of care, commencing during the inpatient period after an acute coronary event (phase I), continuing through the post-discharge period,

often in an outpatient setting (phase II) and subsequently to a community-based maintenance programme for ongoing adherence to exercise and healthy lifestyle (phase III). However, CR is commonly underused throughout this process: only 30% to 50% of eligible patients are typically referred to outpatient CR, with fewer still completing programmes.<sup>10–13</sup> Consequently, many patients do not achieve long-term risk factor targets.<sup>14</sup> The aims of this document are to (1) apply a framework to CR, (2) identify where continuity of care is at risk, and (3) provide recommendations for improvement in the delivery of CR.
