

*shipped by these mills, particularly for material ordered as conforming to the A36 specification, is much stronger than the minimum strength controlled by the specification, and use of the combination of A36 and A572 materials to provide for strong-column-weak-beam conditions will not reliably achieve this goal. In 1997, ASTM introduced a new A992 specification to address this problem. The A992 specification is similar to the ASTM A572, Grade 50 specification, except that maximum as well as minimum yield strengths are specified to provide for more controlled design conditions. In addition, the A992 specification includes increased control on trace elements and can be more weldable than some A572 steels. It is recommended that either A992 or A913 steel be used in SMF applications.*

### 2.6.2 Material Strength Properties

The strength of materials shall be taken as indicated in the *AISC Seismic Provisions* and as modified by these *Recommended Criteria*. Where these *Recommended Criteria* require the use of “expected strength,” this shall be the quantity  $R_y F_y$  as indicated in the *AISC Seismic Provisions*. The value of  $R_y$  for material conforming to *ASTM A992* shall be the same as for material conforming to *ASTM A572 Grade 50*. Where these *Recommended Criteria* require the use of lower-bound strength, or specified strength, the minimum specified value of the yield strength  $F_y$  as indicated in the applicable ASTM specification shall be used.

*Commentary: The AISC Seismic Provisions specify values of  $R_y$  for various materials as indicated in Table 2-1. The quantity  $R_y F_y$  is intended to approximate the mean value of the yield strength of material produced to a given specification and grade. The AISC Seismic Provisions permit other values of  $R_y$  to be used, if the value of the expected mean yield strength  $F_{ye}$  is determined by appropriate testing.*

**Table 2-1 Values of  $R_y$  for Various Material Grades**

Material Specification	$R_y$
ASTM A36	1.5
ASTM A572 Gr. 42	1.3
Other Specifications	1.1

*As part of the program of investigations conducted in support of the development of these Recommended Criteria, studies of the statistical variation in strength properties of rolled sections of Grade 50 steel were conducted. These studies indicate that the 1.1 value for  $R_y$  is a good representation of the mean value of yield strength when applied to the webs of cross sections. The flexural properties of structural steel, however, are more closely related to the yield strength of the flanges of rolled shapes, which tend to have somewhat lower strength than do the webs. When applied to calculations of the flexural strength*
