Models for Biomedical Research, 1985-01-01 *Model Systems in Biology* Georg Striedter, 2022-08-23 How biomedical research using various animal species and in vitro cellular systems has resulted in both major successes and translational failure In *Model Systems in Biology* comparative neurobiologist Georg Striedter examines how biomedical researchers have used animal species and in vitro cellular systems to understand and develop treatments for human diseases ranging from cancer and polio to Alzheimer's disease and schizophrenia Although there have been some major successes much of this translational research on model systems has failed to generalize to humans Striedter explores the history of such research focusing on the models used and considering the question of model selection from a variety of perspectives the philosophical the historical and that of practicing biologists Striedter reviews some philosophical concepts and ethical issues including concerns over animal suffering and the compromises that result He traces the history of the most widely used animal and in vitro models describing how they compete with one another in a changing ecosystem of models He examines how therapies for bacterial and viral infections cancer cardiovascular diseases and neurological disorders have been developed using animal and cell culture models and how research into these diseases has both taken advantage of and been hindered by model system differences Finally Striedter argues for a big tent biology in which a diverse set of models and research strategies can coexist productively

Sechzer,1983 *Towards a More Ethical Animal Model in Biomedical Research* Deborah Anne Najjar,2018 Since the early twentieth century mice have emerged as the standard mammalian model organism for biomedical research When pain relief is provided during experimentation it typically comes in the form of transient and sometimes ineffective analgesics or anesthesia This thesis proposes an alternative to the current method of research in the form of an engineered mouse model in which pain sensing can be ablated before an experiment An ERT2 inducible Cre recombinase under the Wntl promoter was designed to be combined with a floxed Nav1 7 ion channel mouse model When a 4 hydrotamoxifan class small molecule is fed to the mouse Cre recombinase expression in the peripheral nervous system will disrupt function of the ion channel involved in inflammatory and mechanosensory pain Additional designs for floxed Nav1 6 ion channel and Nax ion like channel were made to explore disruption of peripheral cancer induced neuropathic pain In parallel with mouse model development a survey was conducted to understand the potential for adoption of this new animal model by researchers The survey was sent to IACUC members questioning if this model was needed as well as how it may be regulated under the existing protocol approval framework Results indicated that there is a both a need and desire for further refinement strategies within animal research and that this inducible painfree mouse model could be categorized as alternative analgesic upon sufficient characterization and peer reviewed publications Additional input was provided that will shape testing done on the generated animals to assure that this model can mitigate animal suffering while still recapitulating important biological processes investigated in biomedical research
