Food process engineering a branch of both food science and chemical engineering has evolved over the years since its inception and still is a rapidly changing discipline While traditionally the main objective of food process engineering was preservation and stabilization the focus today has shifted to enhance health aspects flavour and taste nutrition sustainable production food security and also to ensure more diversity for the increasing demand of consumers The food industry is becoming increasingly competitive and dynamic and strives to develop high quality freshly prepared food products To achieve this objective food manufacturers are today presented with a growing array of new technologies that have the potential to improve or replace conventional processing technologies to deliver higher quality and better consumer targeted food products which meet many if not all of the demands of the modern consumer These new or innovative technologies are in various stages of development including some still at the R D stage and others that have been commercialised as alternatives to conventional processing technologies Food

process engineering comprises a series of unit operations traditionally applied in the food industry. One major component of these operations relates to the application of heat directly or indirectly to provide foods free from pathogenic microorganisms but also to enhance or intensify other processes such as extraction, separation or modification of components. The last three decades have also witnessed the advent and adaptation of several operations processes and techniques aimed at producing high quality foods with minimum alteration of sensory and nutritive properties. Some of these innovative technologies have significantly reduced the thermal component in food processing offering alternative nonthermal methods. **Food Processing Technologies: A Comprehensive Review Three Volume Set** covers the latest advances in innovative and nonthermal processing such as high pressure pulsed electric fields, radiofrequency, high intensity pulsed light, ultrasound, irradiation and new hurdle technology. Each section will have an introductory article covering the basic principles and applications of each technology and in depth articles covering the currently available equipment and or the current state of development, food quality and safety application to various sectors, food laws and regulations, consumer acceptance, advancements and future scope. It will also contain case studies and examples to illustrate state of the art applications. Each section will serve as an excellent reference to food industry professionals involved in the processing of a wide range of food categories e.g. meat, seafood, beverage, dairy, eggs, fruits and vegetable products, spices, herbs among others. **Good Packaging**, 1991

Package Engineering, 1978-07 **Food and Packaging Interactions II** Sara J. Risch, Joseph H. Hotchkiss, 1991. Once simply a convenient container to hold and carry food, packaging has now become an integral part of the food chain. This new volume provides the most comprehensive and current information available on food packaging interactions including presentations on migration, scalping and permeability. A significant portion of the volume covers research on microwave susceptor packaging, the materials that promote browning and crisping of products. This is a valuable resource for food product development scientists and engineers who need to understand what can happen to foods in different types of packages. Regulatory agencies can also use this book to keep pace with new developments and to maintain appropriate regulation. Includes information on regulation of packaging for the United States, United Kingdom and European Community.
