Advisory Group on Electron Tubes, 1961 **Conference Proceedings**, 1961 Studies of the Effect of Circuit Tapering on TWT Performance Chih Chiang Lo, Chu-Chung Lo, 1964

The main object of this research was to show that by proper tapering of the circuit characteristics of a pulsed high power traveling wave amplifier longpersisting pulse edge oscillations could be successfully eliminated Several types of circuit tapering have been considered and a particular one was chosen for this empirical study The type of circuit taper which appears to have several advantages over others for suppression of pulse edge oscillations has both the pi mode frequency increased and the phase velocity for the passband frequencies decreased gradually toward the output end of the tube The effect of circuit tapering on forward wave amplification has also been studied A method was introduced for calculating the performance and an increase in gain was predicted for the aforementioned taper by this method when the tube was operated beyond the small signal level This effect was also measured experimentally on a high power tube constructed for this purpose The effect of circuit tapering on tube efficiency has been studied qualitatively By using the conventional velocity phase diagram the possibility of improving the efficiency is indicated However a different kind of circuit tapering other than that used for this study is required
