Brian J. Hoskins, Ian N. James

Midlatitude Weather Systems:

Mid-Latitude Weather Systems Toby N. Carlson, 2012-09-15 Mid Latitude Weather Systems has become a classic text in synoptic meteorology. It is the first text to make extensive use of conventional weather charts and equations to illustrate fully the behavior and evolution of weather patterns. Carlson presents selected concepts facilitating the interpretation of this active and challenging area of study.

Fluid Dynamics of the Mid-Latitude Atmosphere Brian J. Hoskins, Ian N. James, 2014-11-17 This book gives a coherent development of the current understanding of the fluid dynamics of the middle latitude atmosphere. It is primarily aimed at post graduate and advanced undergraduate level students and does not assume any previous knowledge of fluid mechanics, meteorology or atmospheric science. The book will be an invaluable resource for any quantitative atmospheric scientist who wishes to increase their understanding of the subject. The importance of the rotation of the Earth and the stable stratification of its atmosphere with their implications for the balance of larger scale flows is highlighted throughout. Clearly structured throughout the first of three themes deals with the development of the basic equations for an atmosphere on a rotating spherical planet and discusses scale analyses of these equations. The second theme explores the importance of rotation and introduces vorticity and potential vorticity as well as turbulence. In the third theme the concepts developed in the first two themes are used to give an understanding of balanced motion in real atmospheric phenomena. It starts with quasi geostrophic theory and moves on to linear and nonlinear theories for mid latitude weather systems and their fronts. The potential vorticity perspective on weather systems is highlighted with a discussion of the Rossby wave propagation and potential vorticity mixing covered in the final chapter.

Information Theory and Stochastics for Multiscale Nonlinear Systems Andrew Majda, Rafail V. Abramov, Marcus J. Grote, 2005 This book introduces mathematicians to the fascinating mathematical interplay between ideas from stochastics and information theory and practical issues in studying complex multiscale nonlinear systems. It emphasizes the serendipity between modern applied mathematics and applications where rigorous analysis, the development of qualitative and or asymptotic models and numerical modeling all interact to explain complex phenomena. After a brief introduction to the emerging issues in multiscale modeling the book has three main chapters. The first chapter is an introduction to information theory with novel applications to statistical mechanics, predictability and Jupiter's Red Spot for geophysical flows. The second chapter discusses new mathematical issues regarding fluctuation-dissipation theorems for complex nonlinear systems including information flow, various approximations and illustrates applications to various mathematical models. The third chapter discusses stochastic modeling of complex nonlinear systems. After a general discussion a new elementary model motivated by issues in climate dynamics is utilized to develop a self-contained example of stochastic mode reduction. Based on A. Majda's Aisenstadt lectures at the University of Montreal the book is appropriate for both pure and applied mathematics graduate students, postdocs and faculty as well as interested researchers in other scientific disciplines. No background in geophysical flows is required. About

the authors Andrew Majda is a member of the National Academy of Sciences and has received numerous honors and awards including the National Academy of Science Prize in Applied Mathematics the John von Neumann Prize of the Society of Industrial and Applied Mathematics the Gibbs Prize of the American Mathematical Society and the Medal of the College de France In the past several years at the Courant Institute Majda and a multi disciplinary faculty have created the Center for Atmosphere Ocean Science to promote cross disciplinary research with modern applied mathematics in climate modeling and prediction R V Abramov is a young researcher he received his PhD in 2002 M J Grote received his Ph D under Joseph B Keller at Stanford University in 1995
