Molecular Basis Of Pancreas Development And Function:

Molecular Basis of Pancreas Development and Function Joel F. Habener, Mehboob Hussain, 2012-12-06 Diabetes mellitus is rapidly increasing in prevalence throughout both developed and developing countries. The social and economic burden of this disease is estimated to cost 14 billion dollars worldwide. In the USA alone 15 million individuals are diabetic, nearly half of them unaware of their condition. Complications of diabetes mellitus are the leading causes for blindness, limb amputation, and chronic renal failure, and kidney transplantation in industrialized countries. Further, diabetes mellitus per se and the metabolic derangement associated with diabetes are important risk factors for cardiovascular disease. Diabetes as defined by an elevated fasting blood glucose level is presently subdivided into etiologically distinct groups. The most prevalent being type 2 adult onset diabetes, characterized by insulin resistance and failure of the cell to supply insulin in amounts sufficient to meet the body's needs. Type 1 juvenile diabetes, most commonly with an onset during childhood and adolescence, is caused by an autoimmune destruction of the pancreatic cells. The causations of both type 1 and type 2 diabetes involve a combination of complex genetic traits and environmental influences. A third category are the mature onset diabetes of the young (MODY). This comparatively small group of patients, 10% of diabetes, presents relatively early in life, 30 years of age compared to the more common late onset type 2 diabetes. *Biomedical Index to PHS-supported Research*, 1994
