

What is a **Polymer**?

A **polymer** is a large molecule composed of repeating structural units, typically linked together by covalent bonds.

These units, called **monomers**, form long chains, creating a macromolecular structure.

Polymers exhibit diverse properties and are crucial in various fields, including materials science and biology.

Examples include synthetic polymers like plastics and rubber, as well as natural polymers such as proteins, DNA, and cellulose.

The versatility of polymers stems from their unique chemical and physical characteristics, making them essential in the development of a wide range of materials and biological structures.
