

K-THEORETIC METHODS IN BIFURCATION THEORY

by J. Pejsachowicz

Introduction – Homotopy theoretic methods in several parameter bifurcation theory were developed in the past decade mainly by the work of J.C. Alexander and J. Ize ([2], [17]) among others. The Alexander approach in [2] can be sketched as follows: (see [11] for a rather complete description).

Consider a family $f_p : \mathbf{R}^n \rightarrow \mathbf{R}^n$ parametrized by $p \in \mathbf{R}^k$, with $f_p(0) = 0$ and let L_p be the derivative of f_p at 0. Let p_0 be an isolated point in the set $\Sigma(f)$ of all parameters at which the derivative L_p is singular. Restricting the map $p \mapsto L_p$ to the boundary of a small disk D centered at p_0 one gets an element γ_f in the homotopy group $\pi_{k-1}(GL(n))$. This element is an obstruction to the existence of a deformation of the map $L : (D, \partial D) \rightarrow (M^{n \times n}, GL(n))$ to a map into $GL(n)$. The point p_0 is a bifurcation point of f provided the image of γ_f by the classical J -homomorphism is nontrivial.

More general situations e.g. compact vector fields or smooth Fredholm maps can be reduced to the above one by standard arguments. Computation of the relevant invariants are presented in [2], [3], [11]. In [18] Ize, using obstruction theory, completely determines all bifurcation invariants that can be obtained from the behavior of the linearization in a neighborhood of an isolated point. The assumption that $\Sigma(f)$ is discrete is not generic if $k > 1$. At non isolated points one usually restricts the parameters to submanifolds transversal to $\Sigma(f)$. (See [19]).

The purpose of the present paper is to discuss similar topics for families of semilinear Fredholm maps (compact perturbations of linear Fredholm operators of index 0) parametrized by compact spaces. This theory presents new and rather interesting aspects reflecting the fact that the space of linear Fredholm operators has non trivial homotopy groups.

Formally our bifurcation invariant is the global version of Alexander's. As such it has different properties. To some extent our approach is inspired by the treatment of families of linear Fredholm operators in [6], [15], [20].

Let $f_p : X \rightarrow Y$ be a family of semilinear Fredholm maps parametrized by a compact connected CW-complex P with $f_p(0) = 0$, for any p in P . Taking the derivative at 0 we get a continuous family $L = \{L_p\}_{p \in P}$ of Fredholm operators of index 0. The obstruction to deforming such a family to a family of isomorphisms is an element $\text{Ind } L$ of the reduced Grothendieck group of virtual vector bundles $\tilde{K}O(P)$, called the analytical index of the family. Quite naturally our bifurcation invariant is $J(\text{Ind } L)$, where now $J : \tilde{K}O(P) \rightarrow \tilde{J}(P)$ is the generalized J -homomorphism of Atiyah-Adams. For parameter spaces on which J is an isomorphism this gives a simple geometric description of bifurcation. Roughly speaking, it arises whenever the family of the derivatives cannot be deformed into $GL(X, Y)$. $J(\text{Ind } L)$ is invariant by compact perturbations and hence it depends only on the principal part of L (higher order terms in the case of differential
