Strongly Interacting Quantum Systems out of Equilibrium Thierry Giamarchi, Andrew J. Millis, Olivier Parcollet, Hubert Saleur, Leticia F. Cugliandolo, 2016-11-17 Over the last decade new experimental tools and theoretical concepts are providing new insights into collective nonequilibrium behavior of quantum systems The exquisite control provided by laser trapping and cooling techniques allows us to observe the behavior of condensed Bose and degenerate Fermi gases under nonequilibrium drive or after quenches in which a Hamiltonian parameter is suddenly or slowly changed On the solid state front high intensity short time pulses and fast femtosecond probes allow solids to be put into highly excited states and probed before relaxation and dissipation occur Experimental developments are matched by progress in theoretical techniques ranging from exact solutions of strongly interacting nonequilibrium models to new approaches to nonequilibrium numerics The summer school Strongly interacting quantum systems out of equilibrium held at the Les Houches School of Physics as its XCIX session was designed to summarize this progress lay out the open questions and define directions for future work This book collects the lecture notes of the main courses given in this summer school **Out of Equilibrium Dynamics**, 2012

equilibrium properties of one dimensional problems are well studied and understood theoretically for a vast amount of interacting models from lattice spin chains to quantum fields in a continuum This progress was allowed by the development of diverse powerful techniques for instance Bethe ansatz renormalization group bosonization matrix product states and conformal field theory Although the equilibrium characteristics of many models are known this is in general not enough to describe their non equilibrium behaviors the latter often remain less explored and much less understood Quantum impurity models represent some of the simplest many body problems But despite their apparent simplicity they can capture several important experimental phenomena from the Kondo effect in metals to transport in nanostructures such as point contacts or quantum dots In this thesis consider a classic impurity model the interacting resonant level model IRLM The model describes spinless fermions in two semi infinite leads that are coupled to a resonant level called quantum dot or impurity via weak tunneling and Coulomb repulsion We are interested in out of equilibrium situations where some particle current flows through the dot and study transport characteristics like the steady current versus voltage differential conductance backscattered current current noise or the entanglement entropy We perform extensive state of the art computer simulations of model dynamics with the time dependent density renormalization group method tDMRG which is based on a matrix product state description of the wave functions We obtain highly accurate results concerning the current voltage and noise voltage curves of the IRLM in a wide range parameter of the model voltage bias interaction strength tunneling amplitude to the dot etc These numerical results are analyzed in the light of some exact out of equilibrium field theory results that have been obtained for a model similar to the IRLM the boundary sine Gordon model BSG This analysis is in particular based on identifying an emerging Kondo energy scale and relevant exponents describing the high and low voltage regimes At the two specific points where the models are known to be equivalent our results agree perfectly with the exact solution Away from these two points we find that within the precision of our simulations the transport curves of the IRLM and BSG remain very similar which was not expected and which remains somewhat unexplained

Nonequilibrium Statistical Physics of Small Systems Rainer Klages, Wolfram Just, Christopher Jarzynski, 2013-03-15 This book offers a comprehensive picture of nonequilibrium phenomena in nanoscale systems Written by internationally recognized experts in the field this book strikes a balance between theory and experiment and includes in depth introductions to nonequilibrium fluctuation relations nonlinear dynamics and transport single molecule experiments and molecular diffusion in nanopores The authors explore the application of these concepts to nano and biosystems by cross linking key methods and ideas from nonequilibrium statistical physics thermodynamics stochastic theory and dynamical systems By providing an up to date survey of small systems physics the text serves as both a valuable reference for experienced researchers and as an ideal starting point for graduate level students entering this newly emerging research field

models such as hyperbolic discounting attribute based models and the reference time theory Part IV describes the evidence on classical game theory and considers several models of behavioral game theory including level k and cognitive hierarchy models quantal response equilibrium and psychological game theory Part V considers behavioral models of learning that include evolutionary game theory classical models of learning experience weighted attraction model learning direction theory and stochastic social dynamics Part VI studies the role of emotions among other topics it considers projection bias temptation preferences happiness economics and interaction between emotions and cognition Part VII considers bounded rationality The three main topics considered are judgment heuristics and biases mental accounting and behavioral finance **Untangling**

Complex Systems Pier Luigi Gentili, 2018-09-03 Complex Systems are natural systems that science is unable to describe exhaustively Examples of Complex Systems are both unicellular and multicellular living beings human brains human immune systems ecosystems human societies the global economy the climate and geology of our planet This book is an account of a marvelous interdisciplinary journey the author made to understand properties of the Complex Systems He has undertaken his trip equipped with the fundamental principles of physical chemistry in particular the Second Law of Thermodynamics that describes the spontaneous evolution of our universe and the tools of Non linear dynamics By dealing with many disciplines in particular chemistry biology physics economy and philosophy the author demonstrates that Complex Systems are intertwined networks working in out of equilibrium conditions which exhibit emergent properties such as self organization phenomena and chaotic behaviors in time and space Statistical Dynamics: Matter Out Of Equilibrium Radu Balescu, 1997-04-19 In the first part of this book classical nonequilibrium statistical mechanics is developed Starting from the Hamiltonian dynamics of the molecules it leads through the irreversible kinetic equations to the level of fluid mechanics For simple systems all the transport coefficients are determined by the molecular properties The second part of the book treats complex systems that require a more extensive use of statistical concepts Such problems which are at the forefront of research include continuous time random walks non Markovian diffusion processes percolation and related critical phenomena transport on fractal structures transport and deterministic chaos These strange transport processes differ significantly from the usual diffusive transport Their inclusion in a general treatise on statistical mechanics is a special feature of this invaluable book a
