Materials And Process Integration For MemS:

Materials & Process Integration for MEMS Francis E. H. Tay, 2013-06-29 The field of materials and process integration for MEMS research has an extensive past as well as a long and promising future Researchers academicians and engineers from around the world are increasingly devoting their efforts on the materials and process integration issues and opportunities in MEMS devices These efforts are crucial to sustain the long term growth of the MEMS field The commercial MEMS community is heavily driven by the push for profitable and sustainable products In the course of establishing high volume and low cost production processes the critical importance of materials properties behaviors reliability reproducibility and predictability as well as process integration of compatible materials systems become apparent Although standard IC fabrication steps particularly lithographic techniques are leveraged heavily in the creation of MEMS devices additional customized and novel micromachining techniques are needed to develop sophisticated MEMS structures One of the most common techniques is bulk micromachining by which micromechanical structures are created by etching into the bulk of the substrates with either anisotropic etching with strong alkali solution or deep reactive ion etching (DRIE) The second common technique is surface micromachining by which planar microstructures are created by sequential deposition and etching of thin films on the surface of the substrate followed by a final removal of sacrificial layers to release suspended structures Other techniques include deep lithography and plating to create metal structures with high aspect ratios LIGA micro electrodischarge machining (J)
