**Moving to Think** Bettie C. Clouser, Walk into almost any elementary school math class and you will see the same scene children sitting completely still at desks staring at worksheets We treat the brain as an isolated hard drive believing that physical stillness is the absolute prerequisite for intellectual focus and abstract thought This approach violently contradicts how the human brain actually develops Cognitive neuroscience has proven that children do not process abstract concepts like geometry or fractions purely through visual or auditory input They literally need to feel the spatial relationships in their muscles movement is not a distraction it is the primary engine of early learning This book breaks down the science of embodied cognition in education It reveals how physical movement balance and spatial navigation are deeply entangled with mathematical reasoning and why forcing young children to sit still actively sabotages their ability to grasp complex abstract logic Transform your approach to early education Teachers and parents will discover practical dynamic strategies to integrate movement into academic lessons creating kinesthetic classrooms where physical activity is weaponized to build deep lasting neurological pathways for advanced problem solving
