Risk Estimation For Multifactorial Diseases

Richard Allen King, Jerome I. Rotter

Risk Estimation For Multifactorial Diseases:

ICRP Publication 83 ICRP,2000-12-31 ICRP Publication 83 reviews data on naturally occurring multifactorial diseases and develops a mathematical model to predict the impact of radiation induced mutations on the frequencies of these diseases in the population It provides a broad outline of the aetiological features and examples of multifactorial diseases It considers the concepts and models used to explain their inheritance patterns with particular emphasis on the Multifactorial Threshold Model Conceptual differences from mendelian diseases are discussed and pertinent epidemiology is reviewed Particular attention is paid to diabetes mellitus and to coronary heart disease Mechanistic models in population genetics are considered The concepts of liability threshold mutation selection balance and mutation component are integrated into a Finite Locus Threshold Model as a basis for risk estimation The relevance of these findings for estimation of radiation risk of multifactorial diseases is discussed *Health Risks from Exposure to Low Levels of Ionizing Radiation* National Research Council,Division on Earth and Life Studies,Board on Radiation Effects Research,Committee to Assess Health Risks from Exposure to Low Levels of Ionizing Radiation,2006-04-23 BEIR VII develops the most up to date and comprehensive risk estimates for cancer and other health effects from exposure to low level ionizing radiation It is among the first reports of its kind to include detailed estimates for cancer incidence in addition to cancer mortality In general BEIR VII supports previously reported risk estimates for cancer and leukemia but the availability of new and more extensive data have strengthened confidence in these estimates A comprehensive review of available biological and biophysical data supports a linear no threshold LNT risk model that the risk of cancer proceeds in a linear fashion at lower doses without a threshold and that the smallest dose has the potential to cause a small increase in risk to humans The report is from the Board on Radiation Research Effects that is now part of the newly formed Nuclear and Radiation Studies Board **Comprehensive Biomedical Physics** ,2014-07-25 *Comprehensive Biomedical Physics* Ten Volume Set is a new reference work that provides the first point of entry to the literature for all scientists interested in biomedical physics It is of particularly use for graduate and postgraduate students in the areas of medical biophysics This Work is indispensable to all serious readers in this interdisciplinary area where physics is applied in medicine and biology Written by leading scientists who have evaluated and summarized the most important methods principles technologies and data within the field *Comprehensive Biomedical Physics* is a vital addition to the reference libraries of those working within the areas of medical imaging radiation sources detectors biology safety and therapy physiology and pharmacology as well as in the treatment of different clinical conditions and bioinformatics This Work will be valuable to students working in all aspect of medical biophysics including medical imaging and biomedical radiation science and therapy physiology pharmacology and treatment of clinical conditions and bioinformatics The most comprehensive work on biomedical physics ever published Covers one of the fastest growing areas in the physical sciences including interdisciplinary areas ranging from advanced nuclear physics and quantum mechanics through mathematics to
