Dendritic Cell Interactions with Bacteria Maria Rescigno,2007-04-19 Emerging evidence suggests that dendritic cells play a major role in the orchestration of the immune response to bacteria This volume introduces the reader to the complex world of dendritic cells and describes how the intimate interplay between dendritic cells bacteria and the environment dictates either the induction of immunity or tolerance to the encountered microorganisms It discusses how this can allow organisms to tolerate beneficial bacteria and to react against pathogens as well as the strategies pathogenic bacteria have evolved to escape dendritic cell patrolling Expert contributors discuss everything from bacterial capture and recognition to their killing processing and the induction of adaptive immunity Particular focus is on the tissue context in which bacteria are handled by dendritic cells and on possible defects therein which may potentially lead to chronic infection or inflammation Graduate students and researchers will find this an invaluable overview of current dendritic cell biology research

Microbiological Reviews ,1991 Bacterial Cell-to-Cell Communication Donald R. Demuth,Richard Lamont,2006-02-23 Many bacterial diseases are caused by organisms growing together as communities or biofilms These microorganisms have the capacity to coordinately regulate specific sets of genes by sensing and communicating amongst themselves utilizing a variety of signals This book examines the mechanisms of quorum sensing and cell to cell communication in bacteria and the roles that these processes play in regulating virulence bacterial interactions with host tissues and microbial development Recent studies suggest that microbial cell to cell communication plays an important role in the pathogenesis of a variety of disease processes Furthermore some bacterial signal molecules may possess immunomodulatory activity Thus understanding the mechanisms and outcomes of bacterial cell to cell communication has important implications for appreciating host pathogen interactions and ultimately may provide new targets for antimicrobial therapies that block or interfere with these communication networks Microbial Cell Surface Analysis Nava Mozes,1991

Cell Interactions and Development Kenneth M. Yamada, 1983 *Intra- and inter-species interactions in microbial communities* Luis Raul Comolli, Birgit Luef, Manfred Auer, 2015-03-03

Recent developments in various OMICs fields have revolutionized our understanding of the vast diversity and ubiquity of microbes in the biosphere. However, most of the current paradigms of microbial cell biology and our view of how microbes live and what they are capable of are derived from in vitro experiments on isolated strains. Even the co-culturing of mixed species to interrogate community behavior is relatively new. But the majority of microorganisms lives in complex communities in natural environments under varying conditions and often cannot be cultivated. Unless we obtain a detailed understanding of the near-native 3D ultrastructure of individual community members, the 3D spatial community organization, their metabolic interdependences, coordinated gene expression, and the spatial organization of their macromolecular machines, inventories, as well as their communication strategies, we won't be able to truly understand microbial community life. How spatial and also temporal organization in cell-cell interactions are achieved remains largely elusive. For example, a key question in microbial ecology is what mechanisms microbes employ to respond when faced with prey, competitors, or predators and changes in external factors. Specifically, to what degree do bacterial cells in biofilms act individually or with coordinated responses? What are the spatial extent and coherence of coordinated responses? In addition, networks linking organisms across a dynamic range of physical constraints and connections should provide the basis for linked evolutionary changes under pressure from a changing environment. Therefore, we need to investigate microbial responses to altered or adverse environmental conditions, including phages, predators, and competitors, and their macromolecular metabolic responses according to their spatial organization. We envision a diverse set of tools, including optical, spectroscopic, chemical, and ultrastructural imaging techniques that will be utilized to address questions regarding e.g. intra- and inter-organism interactions linked to ultrastructure and correlated adaptive responses in gene expression, physiological, and metabolic states as a consequence of the alterations of their environment. Clearly, strategies for co-evolution and, in general, the display of adaptive strategies of a microbial network as a response to the altered environment are of high interest. While a special focus will be placed on terrestrial, sole species, or mixed biofilms, we are also interested in aquatic systems, biofilms in general, and microbes living in symbiosis. In this Research Topic, we wish to summarize and review results investigating interactions and possibly networks between microbes of the same or different species, their co-occurrence, as well as spatiotemporal patterns of distribution. Our goal is to include a broad spectrum of experimental and theoretical contributions from research and review articles to hypothesis and theory aiming at understanding microbial interactions at a systems level.
