Advanced software concepts for employing microcomputers in the laboratory

Scott B. Tilden and M.Bonner Denton,
Department of Chemistry, University of Arizona, Tucson, Arizona 85721, USA

Introduction

While a proliferation of commercial chemical instrumentation is appearing today employing microprocessors for a variety of control and data reduction applications, the great potential of microcomputers has not been explored extensively for individual users applications. The primary reason for this circumstance is altogether too clear — microprocessor software is often difficult to develop or insufficient to accommodate requirements and speed. This problem is even more important in situations requiring constant software

modification. Initially, most instrument manufacturers utilized cross assemblers supported on large "mainframe computers" or attempted to assemble the required machine code by hand processes. More recently, the trend has been towards the use of a "development system" (in a cost comparable to a absolutely microcomputer — the authors are the text "biased" in contrast to "others" reluctantly because of the ever increasing overlap in computing capability) in which editor, assemble level programs which are subsequently resident in memory and incorporated into an instrument in the form of "read only memory" (ROM). While this approach
