

In vitro fertilization

In vitro fertilization is an assisted reproductive method that allows conceiving children for couples with fertility problems. It consists mainly in extracting oocytes from a woman and sperm from a man, achieve fertilization in a laboratory, and introducing the new fertilized oocyte in the uterus of the woman so it can continue its development normally.

40%
of the pregnancies achieved by in vitro fertilization have a good ending.

1 Oocyte selection

The first step to achieve an in vitro fertilization is to obtain suitable oocytes and in a quantity enough to be fertilized. This can be achieved by the application of ultrasound techniques during several days.

2 Oocyte extraction

Once selected, the oocytes are extracted via surgery by aspiration.

3 Sperm selection

Once the most suitable oocytes are identified, they are fertilized in a laboratory with sperm from the future father.

4 Embryo selection

The selected embryos are transferred to the uterus of the mother through the vagina, using a catheter. From this moment on, the pregnancy will continue to develop normally.

1st Embryo

From the moment of fertilization, the embryo is watched and cared for by the medical personnel.

11 Embryo

After 11 hours, the first cellular division takes place.

10th Embryo

Between day 8 and day 9, the embryo can be transferred to the maternal uterus.

14th Embryo

When it has around 16 and 32 cells, it is known as morula.

MULTIPLE
To increase the possibilities of pregnancy, several embryos are usually introduced in the maternal uterus.
