Abstract

Research in quantum electronics over several decades has fueled the creation and rapid growth of today's wireless communications market. Sales of electronic components into this market exceeded \$25 billion in 2006. Nearly all cellular handsets sold today include integrated circuits (ICs) based on energy gap engineered transistors—high-electron mobility transistors (HEMTs) and heterojunction base transistors (HBTs). The success of these technologies notwithstanding, future wireless communications systems will require even more demanding IC performance, especially in the areas of linearity and low noise. We propose that a new concept in transistor design, wave-function engineering, offers un-tapped opportunities to realize these needed performance improvements.

1. Introduction

It is not too bold a claim to state that the current success of the commercial wireless technology industry rests heavily on past developments in the multifaceted fields of quantum electronics and quantum optoelectronics. Our motivation to explore this relationship is to show how the figures of merit (FOM) of commercial electronic integrated circuits (ICs) used in this industry are clearly dependent on the state of the art in quantum electronics. The largest segment of the wireless industry, cellular telephony, has evolved over the past 20 years from first generation (1G) analog systems like AMPS, through 2G digital modulation systems such as GSM, PHS, and CDMA, and recently into 3G systems (WCDMA, TD-SCDMA, and others) incorporating spread spectrum modulation schemes [1]. Analyzing this recent shift from 2G to 3G systems, one can identify the most important quantum electronic device FOM—power, efficiency, and linearity—that are making this transition possible. To realize 4G systems, the requirements for component linearity will be even more

demanding, due to increased density in voice and data traffic. By considering the performance required of commercial ICs for 3G, and soon 4G, system deployment, we hope to suggest a direction forward for device development in the quantum electronics field.

2. Wireless technology market

Market research estimates the total revenue for the semiconductor industry at approximately \$250 billion in 2006, divided across many applications in both military and commercial markets. Of this total, over \$25 billion is attributable to components serving the wireless market, including cellular handsets and base stations, Wi-Fi networks (802.11 a/b/g), and other systems. Further segmenting this market, approximately \$17 billion derives from sales of over 1 billion cellular handsets in 2006. By 2010, the total revenue for wireless system components is predicted to be over \$35 billion, reflecting a compound annual growth rate (CAGR) of around 9%. This growth prediction depends heavily on the deployment of new features for existing wireless technologies, and on new network formats such as WiMax.

In the same way that developments in quantum electronics have formed the basis for the growth of the wireless market, the needs of this market are driving new
