Krzanowski, 1990 This book is an introduction to the principles and methodology of modern multivariate statistical analysis It is written for the user and potential user of multivariate techniques as well as for postgraduate students coming to the subject for the first time The author s emphasis is problem oriented he stresses geometrical intuition in preference to algebraic manipulation Mathematical sections which are not essential for a practical understanding of technique are clearly indicated so they may be skipped by nonspecialists The book covers recent developments concerning discrete and mixed variable techniques as well as continuous variable techniques and other new ideas This is an up to date and very readable account with a practical emphasis for research workers in subjects as diverse as anthropology education industry medicine and taxonomy *Principles of Multivariate Analysis* Wojtek

Krzanowski, 2000-09-28 This book is an introduction to the principles and methodology of modern multivariate statistical analysis It is written for the user and potential user of multivariate techniques as well as for students coming to the subject for the first time The author s emphasis is problem orientated and he is at pains to stress geometrical intuition in preference to algebraic manipulation Mathematical sections that are not essential for a practical understanding of the techniques are clearly indicated so that they may be skipped by the non specialist Discrete and mixed variable techniques are presented as well as continuous variable techniques to give a comprehensive coverage of the subject This updated edition includes a new appendix which traces developments that have taken place in the years since the publication of the first edition and which clarifies some issues raised by readers of the original text References to about 60 recent books and articles supplement the material in this appendix Overall this volume provides an up to date and readable practical account of the subject both for students of statistics and for research workers in subjects as diverse as anthropology education industry medicine and taxonomy The new edition includes a survey of the most recent developments in the subject **Statistical Modelling in**

GLIM 4 Murray A. Aitkin, Brian Francis, John Hinde, 2005 This text examines the theory of statistical modelling with generalised linear models It also looks at applications of the theory to practical problems using the GLIM4 package Provided by publisher **Highly Structured Stochastic Systems** Peter J. Green, Nils Lid Hjort, Sylvia Richardson, 2003 Highly Structured Stochastic Systems HSSS is a modern strategy for building statistical models for challenging real world problems for computing with them and for interpreting the resulting inferences Complexity is handled by working up from simple local assumptions in a coherent way and that is the key to modelling computation inference and interpretation the unifying framework is that of Bayesian hierarchical models The aim of this book is to make recent developments in HSSS accessible to a general statistical audience Graphical modelling and Markov chain Monte Carlo MCMC methodology are central to the field and in this text they are covered in depth The chapters on graphical modelling focus on causality and its interplay with time the role of latent variables and on some innovative applications Those on Monte Carlo algorithms include discussion of

the impact of recent theoretical work on the evaluation of performance in MCMC extensions to variable dimension problems and methods for dynamic problems based on particle filters Coverage of these underlying methodologies is balanced by substantive areas of application in the areas of spatial statistics with epidemiological ecological and image analysis applications and biology including infectious diseases gene mapping and evolutionary genetics The book concludes with two topics model criticism and Bayesian nonparametrics that seek to challenge the parametric assumptions that otherwise underlie most HSSS models Altogether there are 15 topics in the book and for each there is a substantial article by a leading author in the field and two invited commentaries that complement extend or discuss the main article and should be read in parallel All authors are distinguished researchers in the field and were active participants in an international research programme on HSSS This is the 27th volume in the Oxford Statistical Science Series which includes texts and monographs covering many topics of current research interest in pure and applied statistics These texts focus on topics that have been at the forefront of research interest for several years Other books in the series include J Durbin and S J Koopman Time series analysis by State Space Models Peter J Diggle Patrick Heagerty Kung Yee Liang Scott L Zeger Analysis of Longitudinal Data 2 e J K Lindsey Nonlinear Models in Medical Statistics Peter J Green Nils L Hjort and Sylvia Richardson Highly Structured Stochastic Systems Margaret S Pepe Statistical Evaluation of Medical Tests

Time Series Peter Diggle, 2024-12-24 Time series analysis is one of several branches of statistics whose practical importance has increased with the availability of powerful computational tools Methodology that was originally developed for specialized applications for example in finance or geophysics is now widely available within general statistical packages The second edition of Time Series A Biostatistical Introduction is an introductory account of time series analysis written from the perspective of applied statisticians whose interests lie primarily in the biomedical and health sciences This edition has a stronger focus on substantive applications in which each statistical analysis is directed at a specific research question Separate chapters cover simple descriptive methods of analysis including time plots smoothing the correlogram and the periodogram theory of stationary random processes discrete time models for single series continuous time models for single series generalized linear models for time series of counts models for replicated series spectral analysis and bivariate time series The book is unique in its focus on biomedical and health science applications which has been strengthened in this second edition Nevertheless the methods described are more widely applicable It should be useful to teachers and students on masters level degree courses in statistics biostatistics and epidemiology and to biomedical and health scientists with a knowledge of statistical methods at undergraduate level Throughout examples based on real datasets show a close interplay between statistical method and substantive science This book will also describe the implementation of the methods in the R computing environment and provide access to R code and datasets

The Statistical Evaluation of Medical Tests for Classification and Prediction Margaret Sullivan Pepe,2003-03-13 The use of clinical and laboratory information to detect conditions and predict patient outcomes is a mainstay of medical practice Modern biotechnology offers increasing potential to develop sophisticated tests for these purposes This book describes the statistical concepts and techniques for evaluating the accuracy of medical tests Worked examples include applications to cancer biomarker studies prospective disease screening studies diagnostic radiology studies and audiology testing studies The statistical methodology can be broadly applied for evaluating classifiers and to problems beyond medical settings Several measures for quantifying test accuracy are described including the Receiver Operating Characteristic Curve Pepe presents statistical procedures for the estimation and comparison of those measures among tests Regression frameworks for assessing factors that influence test accuracy and for comparing tests while adjusting for such factors are presented The sequence of research steps involved in the development of a test is considered in some detail Sample size calculations and other issues pertinent to study design are described for tests at various phases of development In addition the impacts of missing data and imperfect reference data are addressed These problems often occur in practice and modern statistical procedures for dealing with them are discussed Additional topics that are covered include meta analysis for summarizing the results of multiple studies of a test the evaluation of markers for predicting event time data and procedures for combining the results of multiple tests to improve classification This book should be of interest to quantitative researchers and practicing statisticians The book also covers the theoretical foundations for statistical inference and should therefore be of interest to academic statisticians including those involved in statistical methodological research in this field
