Photonic Integrated Systems Louay A. Eldada, 2003 **Electronic-Photonic Integrated Systems for Ultrafast Signal Processing** Johann Christoph Scheytt, Christian Kress, Manfred Berroth, Stephan Pachnicke, Jeremy Witzens, 2026-03-23

The open access book with the title **Electronic Photonic Integrated Systems for Ultrafast Signal Processing** is a final report of the same titled DFG Priority Programme in the emerging field of integrated electronic photonic systems using novel nanophotonic nanoelectronic semiconductor technologies. The programme is funded by the Deutsche Forschungsgemeinschaft DFG and coordinated by Prof Christoph Scheytt from Heinz Nixdorf Institute Paderborn. Over the course of six years and two project phases overall 19 principal investigators and their respective research groups conducted their research in a total of 20 funded projects. The overall objective of the Priority Programme is to address nanophotonic nanoelectronic technology from a system perspective by investigating fundamental electronic photonic signal processing concepts, algorithms, and novel integrated system architectures using predominantly photonic processing. By photonic electronic integration in advanced photonic electronic semiconductor technologies such as silicon on insulator SOI, silicon nitride SiN, and indium phosphide InP, the limits of electronic signal processing can be disrupted. Ultra fast and energy efficient information processing is required in many applications such as communication systems, cloud computing, artificial intelligence, smart factory instrumentation, and medical technology. Besides speed and energy efficiency, these systems have unique properties like low cost, miniaturization, robustness, and programmability. The research and the results of the programme can be categorized in three core areas which pertain to Ultra broadband electronic photonic signal processing with bandwidth far beyond electronic bandwidth, Frequency synthesis as well as high speed data converters enabled by ultralow jitter femto second pulse lasers, and Optical THz sensing.

Photonic Integrated Circuit (Pic) Device Structures:

Background, Fabrication Ecosystem, Relevance to Space Systems Applications, and Discussion of Rel National Aeronautics and Space Administration Nasa, 2019-01-14

Electronic integrated circuits are considered one of the most significant technological advances of the 20th century with demonstrated impact in their ability to incorporate successively higher numbers of transistors and construct electronic devices onto a single CMOS chip. Photonic integrated circuits (PICs) exist as the optical analog to integrated circuits, however, in place of transistors, PICs consist of numerous scaled optical components including such building block structures as waveguides, MMIs, lasers, and optical ring resonators. The ability to construct electronic and photonic components on a single microsystems platform offers transformative potential for the development of technologies in fields including communications, biomedical device development, autonomous navigation, and chemical and atmospheric sensing. Developing on-chip systems that provide new avenues for integration and replacement of bulk optical and electro-optic components also reduces size, weight, power, and cost (SWaP-C) limitations, which are important in the selection of instrumentation for specific flight projects. The number of applications currently emerging for complex photonics

systems particularly in data communications warrants additional investigations when considering reliability for space systems development This Body of Knowledge document seeks to provide an overview of existing integrated photonics architectures the current state of design development and fabrication ecosystems in the United States and Europe and potential space applications with emphasis given to associated radiation effects and reliability Alt Shannon Goddard Space Flight Center *Electronic-Photonic Integrated Systems for Ultrafast Signal Processing* Johann Christoph Scheytt,Christian Kress,Manfred Berroth,Stephan Pachnicke,Jeremy Witzens,2026-01-02 The open access book with the title Electronic Photonic Integrated Systems for Ultrafast Signal Processing is a final report of the same titled DFG Priority Programme in the emerging field of integrated electronic photonic systems using novel nanophotonic nanoelectronic semiconductor technologies The programme is funded by the Deutsche Forschungsgemeinschaft DFG and coordinated by Prof Christoph Scheytt from Heinz Nixdorf Institute Paderborn Over the course of six years and two project phases overall 19 principal investigators and their respective research groups conducted their research in a total of 20 funded projects The overall objective of the Priority Programme is to address nanophotonic nanoelectronic technology from a system perspective by investigating fundamental electronic photonic signal processing concepts algorithms and novel integrated system architectures using predominantly photonic processing By photonic electronic integration in advanced photonic electronic semiconductor technologies such as silicon on insulator SOI silicon nitride SiN and indium phosphide InP the limits of electronic signal processing can be disrupted Ultra fast and energy efficient information processing is required in many applications such as communication systems cloud computing artificial intelligence smart factory instrumentation and medical technology Besides speed and energy efficiency these systems have unique properties like low cost miniaturization robustness programmability The research and the results of the programme can be categorized in three core areas which pertain to Ultra broadband electronic photonic signal processing with bandwidth far beyond electronic bandwidth Frequency synthesis as well as high speed data converters enabled by ultralow jitter femto second pulse lasers Optical THz sensing
