

Heat Transfer Notes

- Heat (thermal energy) is created by the movement of particles (atoms) that produces heat.
- Heat (thermal energy) is transferred from one object to another when the objects are at different temperatures.
- Thermal energy always moves from warmer to cooler objects.

Conduction	Convection	Radiation
<ul style="list-style-type: none">○ Conduction is the transfer of heat by direct contact (particles collide)○ Conduction occurs most easily in solids and liquids○ Conductors: substances that transfer thermal energy very well○ Example: metals○ Insulators: substances that do not transfer heat very well○ Example: wood, paper, plastic, foam	<ul style="list-style-type: none">○ Convection is the flow of currents in a liquid or gas○ A current is created when the warmer (less dense) material rises forcing the cooler (more dense) material to sink○ Convection is a cycle in nature responsible for most winds and ocean currents.○ Example: Hot water rising in a pool and cold water sinking. The water on top of the pool is warmer, the bottom is cooler.○ Basement in a house is cooler than the attic	<ul style="list-style-type: none">○ Radiation is heat transfer through space by electromagnetic waves○ Radiation can occur in empty space, as well as in solids, liquids and gases.○ Waves such as visible light, infrared, and ultraviolet light are forms of radiation.○ Examples: Heat from a light bulb, microwave oven, getting a sunburn, cooking hamburgers over a charcoal flame

Thermal Radiation Heat Transfer, 5th Edition John R. Howell, M. Pinar Menguc, Robert Siegel, 2010-09-28 Providing a comprehensive overview of the radiative behavior and properties of materials the fifth edition of this classic textbook describes the physics of radiative heat transfer development of relevant analysis methods and associated mathematical and numerical techniques Retaining the salient features and fundamental coverage that have made it popular Thermal Radiation Heat Transfer Fifth Edition has been carefully streamlined to omit superfluous material yet enhanced to update information with extensive references Includes four new chapters on Inverse Methods Electromagnetic Theory Scattering and Absorption by Particles and Near Field Radiative Transfer Keeping pace with significant developments this book begins by addressing the radiative properties of blackbody and opaque materials and how they are predicted using electromagnetic theory and obtained through measurements It discusses radiative exchange in enclosures without any radiating medium between the surfaces and where heat conduction is included within the boundaries The book also covers the radiative properties of gases and addresses energy exchange when gases and other materials

interact with radiative energy as occurs in furnaces To make this challenging subject matter easily understandable for students the authors have revised and reorganized this textbook to produce a streamlined practical learning tool that Applies the common nomenclature adopted by the major heat transfer journals Consolidates past material reincorporating much of the previous text into appendices Provides an updated expanded and alphabetized collection of references assembling them in one appendix Offers a helpful list of symbols With worked out examples chapter end homework problems and other useful learning features such as concluding remarks and historical notes this new edition continues its tradition of serving both as a comprehensive textbook for those studying and applying radiative transfer and as a repository of vital literary references for the serious researcher

Oxygen-Enhanced Combustion Charles E. Baukal Jr., 2013-03-15 Combustion technology has traditionally been dominated by air fuel combustion However two developments have increased the significance of oxygen enhanced combustion new technologies that produce oxygen less expensively and the increased importance of environmental regulations Advantages of oxygen enhanced combustion include less pollutant emissions as well as increased energy efficiency and productivity Oxygen Enhanced Combustion Second Edition compiles information about using oxygen to enhance industrial heating and melting processes It integrates fundamental principles applications and equipment design in one volume making it a unique resource for specialists implementing the use of oxygen in combustion systems This second edition of the bestselling book has more than doubled in size Extensively updated and expanded it covers significant

advances in the technology that have occurred since the publication of the first edition What s New in This Edition Expanded from 11 chapters to 30 with most of the existing chapters revised A broader view of oxygen enhanced combustion with more than 50 contributors from over 20 organizations around the world More coverage of fundamentals including fluid flow heat transfer noise flame impingement CFD modeling soot formation burner design and burner testing New chapters on applications such as flameless combustion steel reheating iron production cement production power generation fluidized bed combustion chemicals and petrochemicals and diesel engines This book offers a unified up to date look at important commercialized uses of oxygen enhanced combustion in a wide range of industries It brings together the latest knowledge to assist those researching engineering and implementing combustion in power plants engines and other applications
