Selected Topics in Approximation and Computation Marek A. Kowalski,Krzystof A. Sikorski,Frank Stenger,1995-10-19 Selected Topics in Approximation and Computation is a combination of expositions of basic classical methods of approximation leading to popular splines and new explicit tools of computation including sinc methods elliptic function methods and positive operator approximation methods It also provides an excellent summary of worst case analysis in Information Based Complexity It relates optimal computational methods e with the theory of s numbers and m widths

Selected Topics in Approximation and Computation Marek Kowalski,Christopher Sikorski,Frank Stenger,1995-08-31 Selected Topics in Approximation and Computation addresses the relationship between modern approximation theory and computational methods The text is a combination of expositions of basic classical methods of approximation leading to popular splines and new explicit tools of computation including Sinc methods elliptic function methods and positive operator approximation methods It also provides an excellent summary of worst case analysis in information based complexity It relates optimal computational methods with the theory of s numbers and n widths It can serve as a text for senior graduate courses in computer science and applied mathematics and also as a reference for professionals **Nonlocal Modeling, Analysis, and Computation** Qiang Du,2019-03-20 Studies of complexity singularity and anomaly using nonlocal continuum models are steadily gaining popularity This monograph provides an introduction to basic analytical computational and modeling issues and to some of the latest developments in these areas Nonlocal Modeling Analysis and Computation includes motivational examples of nonlocal models basic building blocks of nonlocal vector calculus elements of theory for well posedness and nonlocal spaces connections to and coupling with local models convergence and compatibility of numerical approximations and various applications such as nonlocal dynamics of anomalous diffusion and nonlocal peridynamic models of elasticity and fracture mechanics A particular focus is on nonlocal systems with a finite range of interaction to illustrate their connection to local partial differential equations and fractional PDEs These models are designed to represent nonlocal interactions explicitly and to remain valid for complex systems involving possible singular solutions and they have the potential to be alternatives for as well as bridges to existing models The author discusses ongoing studies of nonlocal models to encourage the discovery of new mathematical theory for nonlocal continuum models and offer new perspectives on traditional models analytical techniques and algorithms **Multivariate Approximation Theory** E. W. Cheney,1986-01-01 The approximation of functions of several variables continues to be a difficult problem in scientific computing because many of the algorithms required for such problems have yet to be written This monograph is written for a broad audience of computational mathematicians and statisticians concerned with the development of algorithms or the derivation of approximations from linear projections of which the interpolating operators are an important example As an aid to both researchers and students a bibliography of more than 200 titles is included <u>Handbook of Sinc Numerical Methods</u> Frank

Stenger,2016-04-19 Handbook of Sinc Numerical Methods presents an ideal road map for handling general numeric problems Reflecting the author s advances with Sinc since 1995 the text most notably provides a detailed exposition of the Sinc separation of variables method for numerically solving the full range of partial differential equations PDEs of interest to scientists and engineers This new theory which combines Sinc convolution with the boundary integral equation IE approach makes for exponentially faster convergence to solutions of differential equations The basis for the approach is the Sinc method of approximating almost every type of operation stemming from calculus via easily computed matrices of very low dimension The downloadable resources of this handbook contain roughly 450 MATLAB programs corresponding to exponentially convergent numerical algorithms for solving nearly every computational problem of science and engineering While the book makes Sinc methods accessible to users wanting to bypass the complete theory it also offers sufficient theoretical details for readers who do want a full working understanding of this exciting area of numerical analysis

Computational Methods in Optimal Control William H. Hager,2025-02-13 Using material from many different sources in a systematic and unified way this self contained book provides both rigorous mathematical theory and practical numerical insights while developing a framework for determining the convergence rate of discrete approximations to optimal control problems Elements of the framework include the reference point the truncation error and a stability theory for the linearized first order optimality conditions Within this framework the discretized control problem has a stationary point whose distance to the reference point is bounded in terms of the truncation error The theory applies to a broad range of discretizations and provides completely new insights into the convergence theory for discrete approximations in optimal control including the relationship between orthogonal collocation and Runge Kutta methods Throughout the book derivatives associated with the discretized control problem are expressed in terms of a back propagated costate In particular the objective derivative of a bang bang or singular control problem with respect to a switch point of the control are obtained which leads to the efficient solution of a class of nonsmooth control problems using a gradient based optimizer Computational Methods in Optimal Control Theory and Practice is intended for numerical analysts and computational scientists Users of the software package GPOPS may find the book useful since the theoretical basis for the GPOPS algorithm is developed within the book It is appropriate for courses in variational analysis numerical optimization and the calculus of variations **Selected Topics in Alegbraic Geometry** National Research Council (U.S.). Committee on Rational Transformations,Virgil Snyder,1928 **Topics in Multivariate Approximation and Interpolation** Kurt Jetter,Martin Buhmann,Werner Haussmann,Robert Schaback,Joachim Stoeckler,2005-11-15 This book is a collection of eleven articles written by leading experts and dealing with special topics in Multivariate Approximation and Interpolation The material discussed here has far reaching applications in many areas of Applied Mathematics such as in Computer Aided Geometric Design in Mathematical Modelling in Signal and Image Processing and in Machine Learning to mention a few The book aims

at giving a comprehensive information leading the reader from the fundamental notions and results of each field to the forefront of research It is an ideal and up to date introduction for graduate students specializing in these topics and for researchers in universities and in industry A collection of articles of highest scientific standard An excellent introduction and overview of recent topics from multivariate approximation A valuable source of references for specialists in the field A representation of the state of the art in selected areas of multivariate approximation A rigorous mathematical introduction to special topics of interdisciplinary research   *History of Mathematics ...: Special topics of elementary mathematics* David Eugene Smith,1925   **Catalog** University of Colorado Boulder,2005   *Annual Calendar of the Negro Agricultural and Technical College of North Carolina* Negro Agricultural and Technical College of North Carolina,North Carolina Agricultural and Technical State University,1950   **Computational Vision and Medical Image Processing IV** Joao Manuel RS Tavares,Jorge R.M.
