Animal Cognition Thomas R. Zentall, 2013-12-02 Prepared as a tribute to Donald A Riley the essays that appear here are representative of a research area that has loosely been classified as animal cognition a categorization that reflects a functionalist philosophy that was prevalent in Riley's laboratory and that many of his students absorbed According to this philosophy it is acceptable to hypothesize that an animal might engage in complex processing of information as long as one can operationalize evidence for such a process and the hypothesis can be presented in the context of testable predictions that can differentiate it from other mechanisms The contributions to this volume represent the three most important areas of research in animal cognition stimulus representation memory processes and perceptual processes although current research has considerably blurred these distinctions

Avian Models for Social Cohesion Andras Csillag, Gergely Zachar, Giorgio Vallortigara, 2020-02-10 Animals living in groups are often linked to group or family members stronger than to other conspecifics and form stronger coalitions often based on genetic relatedness within such groups Effective cooperation within a group requires the preference for proximity of group members suppression of aggression toward conspecifics an ability to perceive and respond to social signals and to change often synchronize behavior accordingly Birds have long been used for a number of investigations involving sensory perception learning feeding strategies and vocal communication Recently they have been proposed as ideal model species even for psychiatric disorders affecting social cohesion such as autism spectrum disorder The physiological mechanisms and neural systems underlying different forms of sociability sexual and parental bonding group preference nesting care for offspring migration can often be studied easier in birds since their social behavioral repertoire as a taxon but sometimes also as individuals is more diverse than that of mammals By contrast with laboratory rodents birds rely less on olfactory cues Rather they tend to use visual and acoustic signals for social interactions much like humans Comparative approach and evolutionary relevance of studies using avian species have already yielded valuable results in several fields of neuroscience learning and memory imprinting acoustic communication birdsong

neurogenesis seasonal changes in the song network With the advent of robust novel methods in molecular biology genomics and proteomics information technology and electronic engineering and also based upon an ever improving battery of behavioral tests avian research in social cohesion has likely gained a new impetus
