Semantic Analysis:

Semantic Analysis Cliff Goddard,2011-08-04 A lively introduction to methods for articulating the meanings of words and sentences and revealing connections between language and culture It shows that the study of meaning can be rigorous insightful and exciting **Stochastically-Based Semantic Analysis** Wolfgang Minker,Alex Waibel,Joseph Mariani,2012-12-06 Stochastically Based Semantic Analysis investigates the problem of automatic natural language understanding in a spoken language dialog system The focus is on the design of a stochastic parser and its evaluation with respect to a conventional rule based method Stochastically Based Semantic Analysis will be of most interest to researchers in artificial intelligence especially those in natural language processing computational linguistics and speech recognition It will also appeal to practicing engineers who work in the area of interactive speech systems *Logical Theory and Semantic Analysis* Stig Kanger,1974-06-30 **Modern Software Engineering Concepts and Practices: Advanced Approaches** Dogru, Ali H.,Biçer, Veli,2010-12-31 Software engineering has advanced rapidly in recent years in parallel with the complexity and scale of software systems New requirements in software systems yield innovative approaches that are developed either through introducing new paradigms or extending the capabilities of well established approaches Modern Software Engineering Concepts and Practices Advanced Approaches provides emerging theoretical approaches and their practices This book includes case studies and real world practices and presents a range of advanced approaches to reflect various perspectives in the discipline **A Semantic Analysis Method for Scientific and Engineering Code** Mark E. M. Stewart,1998 **Semantic Analysis** Paul Ziff,1960 **Incremental Static Semantic Analysis** William Harry Maddox,1997 Abstract Language based programming environments provide some or all of the functionality of a compiler an interactive debugger a browser and a configuration manager behind a unified user interface based on an editing paradigm As the user edits a program the changes are processed incrementally allowing for low latency updates to derived information This information can be made available to interactive environment services such as browsing navigation and real time error reporting In this dissertation we address an important subproblem in the construction of such environments the generation of static semantic analyzers that operate in an incremental mode Our work is embodied in the Colander II system which introduces both a new metalanguage for the declarative specification of static semantic analyses and new techniques for generating an incremental analyzer from these specifications automatically Our specification metalanguage melds the advantages of traditional attribute grammars including amenability to extensive generation time analysis with the expressiveness and client independence characteristic of Ballance s Logical Constraint Grammars In comparison to traditional attribute grammars our metalanguage allows much more of the incrementality inherent in a particular analysis task to be exposed within the formalism itself where it can be exploited automatically by our implementation Our incremental analysis algorithms exploit the attributed objects and function valued attributes provided by our metalanguage mapping

these expressive notations onto a fine grained incremental implementation We are thus able to automatically generate incremental analyzers that handle long distance dependencies and aggregate attributes efficiently Our methods allow unusual freedom to control the granularity of incremental evaluation allowing performance tradeoffs to be chosen as demanded by the needs of the application rather than as dictated by the a priori requirements of the algorithms We have also developed a static analysis and transformation on attribute grammars that accomodates a useful class of circular attribute dependencies automating the backpatching method used in hand coded compilers The transformation is employed in Colander II but is applicable to attribute grammars in general We have used the Colander II system to create a static semantic analyzer for the programming language Modula 2 which has revealed both strengths and weakness in our specification paradigm Interestingly the most significant difficulty that we encountered applies equally to traditional attribute grammars but has not been widely appreciated in the attribute grammar literature Our work was performed in the context of the Ensemble project at UC Berkeley which is constructing a prototype integrated multilingual language based software development environment based on the editing of structured multimedia documents   *A Semantic Analysis of Yup'ik Spatial Deixis* Alison Smiley Rukeyser,2005   *Language Monographs* Linguistic Society of America,1930
