Data objects:

A data object is a part of the repository whose content can be addressed and interpreted by the program

Physical units with which ABAP statements work at runtime.

Contents occupy memory space in a program

ABAP Statements access the contents by addressing the name of the data object

ABAP Statements can write the contents of Data object in report or in the database and also pass/receive from routines and can be changed by assigning new values

Declare objects statically or dynamically

ABAP Data object has a set of technical attributes, defined at all times when the ABAP program is running

Data Types

Data Types can be defined independently,

The definition of a user-defined data type is based on a set of predefined elementary data types.

Define data types either locally in the declaration part of a program using TYPES Statement or globally in the ABAP Dictionary.

Use own data types to declare data objects or to check the types of parameters in generic operations.

Data types can be divided into Elementary, Reference and Complex types.

Elementary Types: are fixed or variable length that are not made up of other types.

The difference between variable length data types and fixed length data types is that the length and the memory space required by data objects of variable length data types can change dynamically during runtime, and that these data types cannot be defined irreversibly while the data object is being declared

Control statements

1. Flow Control
2. Logical Expressions
3. Conditional Statements

Flow of Control

1. External Flow: Events triggered by user or the system
