Reggia, Eytan Ruppin, Rita Sloan Berndt, 1996 During the last few years there has been a rapidly increasing interest in neural modeling of brain and cognitive disorders This multidisciplinary book presents a variety of such models in neurology neuropsychology and psychiatry A review of work in this area is given first Computational models are then presented of memory impairment in Alzheimer s disease functional brain reorganization following a stroke patterns of neural activity in epilepsy disruption of language processes in aphasia and acquired dyslexia altered cognitive processes in schizophrenia and depression and related disorders This is the first book on this topic with contributions from many of the leading researchers in this field

Multiscale Models of Brain Disorders Vassilis Cutsuridis, 2019-10-11 This book focuses on our current understanding of brain dynamics in various brain disorders e g epilepsy Alzheimer s and Parkinson s disease and how the multi scale multi level tools of computational neuroscience can enhance this understanding In recent years there have been significant advances in the study of the dynamics of the disordered brain at both the microscopic and the macroscopic levels This understanding can be furthered by the application of multi scale computational models as integrative principles that may link single neuron dynamics and the dynamics of local and distant brain regions observed using human EEG ERPs MEG LFPs and fMRI Focusing on the computational models that are used to study movement memory and cognitive disorders as well as epilepsy and consciousness related diseases the book brings together physiologists and anatomists investigating cortical circuits cognitive neuroscientists studying brain dynamics and behavior by means of EEG and functional magnetic resonance imaging fMRI and computational neuroscientists using neural modeling techniques to explore local and large scale disordered brain dynamics Covering topics that have a significant impact on the field of medicine neuroscience and computer science the book appeals to a diverse group of investigators

KEY FEATURES
Comprehensive and Comprehensible Very clinically oriented Wealth of new information on Functional Brain Imaging Provides synthesis of information from fields of neurology and psychiatry *Encyclopedia of Cognitive Science: Epilepsy*

Lynn Nadel,2003 At the core of this encyclopedia are approximately 700 original signed articles written and peer reviewed by the world s leading experts in their various specialized areas of the cognitive sciences Forthcoming Books Rose Arny,1997 **Society for Neuroscience Abstracts** Society for Neuroscience. Meeting,1992 Cognitive and Physiological Aspects of Attention to Personally Relevant Negative Information in Depression Greg Jeremy Siegle,1999 Evidence suggests depressed individuals pay excessive attention to negative information The current research investigates the nature and clinical implications of such attention biases A computational neural network reflecting interacting brain systems that identify emotional and nonemotional aspects of information is described in which depression is identified with strongly learning certain negative information The model s behavior suggested that depressed people are reminded of and attend to personally relevant negative information in response to many stimuli Predictions for depressed and nondepressed individuals reaction times signal detection rates and the time course of cognitive load in response to emotional stimuli were derived from the computational model To evaluate these predictions pupil dilations and reaction times were collected from 24 unmedicated depressed and 25 nondepressed adults in response to emotional lexical decision and valence identification tasks Pupil dilation was used to index cognitive load load Mixed ANOVA planned contrasts were employed to evaluate predictions In support of model derived predictions depressed individuals rated many stimuli as negative more than nondepressed individuals The network s behavior suggested that depressed individuals would be quicker to say that negative words were negative than positive words were positive and that this difference would be reduced in nondepressed individuals This prediction was supported empirically Principal components analysis of pupil dilations revealed early attentional components at or before reaction times and late possibly ruminative components peaking 2 and 4 seconds after reaction times The computational model suggested cognitive load indexed by pupil dilation would be highest for nondepressed individuals during early stages of attention but highest for depressed individuals during later stages of attention This prediction was supported Contrary to predictions differences in depressed individuals dilations to positive and negative stimuli were not detected These data suggest depressed individuals may not initially attend to the content of presented information but may quickly associate any incoming information with whatever made them depressed Sustained attention to personally relevant negative information may characterize depressive attention biases Targeting implicated cognitive and brain processes may improve interventions for depression **CSA Neurosciences Abstracts** ,1999 *Index of Conference Proceedings* British Library.
