,2006 **An Intelligent Decision Support System for Work Zone Traffic Management and Planning** Hojjat Adeli,2004 Periodic resurfacing rehabilitation restoration and reconstruction work is needed on the aging highway system to maintain a desired level of service for the traveling public However temporary work zones on highways disrupt the normal flow of traffic and reduce the level of service Freeway work zones have become a major source of traffic congestion and travelers delays which result in reduced freeway capacity increased driver frustration increased traffic accidents increased road user delay cost and increased fuel consumption and vehicle emissions In this research scientific models have been created for estimation of the work zone capacity for the first time A case based reasoning CBR model has been created for

freeway work zone traffic management considering work zone layout traffic demand work characteristics traffic control measures and mobility impacts A freeway work zone traffic delay and cost optimization model has been developed in terms of the length of the work zone segment and the starting time of the work zone using average hourly traffic data An adaptive computational model has been created for estimating the work zone capacity and queue length and delay A neuro fuzzy logic model has been developed for estimation of the freeway work zone capacity taking into account 17 different factors impacting the work zone capacity An object oriented model has been developed for freeway work zone capacity and queue delay and length estimation The model has been implemented into an interactive software system called IntelliZone IntelliZone s capacity estimation engine is based on pattern recognition and neural network models incorporating a large number of factors impacting the work zone capacity This research provides the foundation for a new generation of advanced decision support systems for effective management of traffic at work zones

Neural Network Computing Model for Highway Construction Project Scheduling and Management Hojjat Adeli,1999 A general mathematical formulation has been developed for scheduling of construction projects and applied to the problem of highway construction scheduling Repetitive and non repetitive tasks work continuity considerations multiple crew strategies and the effects of varying job conditions on the performance of a crew can be modeled An optimization formulation is presented for the construction project scheduling problem with the goal of minimizing the direct construction cost The nonlinear optimization problem is then solved by the recently patented neural dynamics model of Adeli and Park United States patent number 5 815 394 issued on September 29 1998 For any given construction duration the model yields the optimum construction schedule for minimum construction cost automatically By varying the construction duration one can solve the cost duration trade off problem and obtain the global optimum schedule and the corresponding minimum construction cost
