Publisher Description **The Oxford Handbook of Language Production** Matthew Goldrick, Victor Ferreira, Michele Miozzo, 2014-04-11 The Oxford Handbook of Language Production provides a comprehensive multidisciplinary review of the complex mechanisms involved in language production. It describes what we know of the computational linguistic cognitive and brain bases of human language production from how we conceive the messages we aim to convey to how we retrieve the right and sometimes wrong words, how we form grammatical sentences and how we assemble and articulate individual sounds, letters and gestures. Contributions from leading psycholinguists, linguists and neuroscientists offer readers a broad perspective on the latest research highlighting key investigations into core aspects of human language processing. The Handbook is organized into three sections: speaking, written and sign languages and how language production interfaces with the wider cognitive system including control processes, memory, non-linguistic gestures and the perceptual system. These chapters discuss a wide array of levels of representation from sentences to individual words, speech sounds and articulatory gestures extending to discourse and the broader social context of speaking. Detailed supporting chapters provide an overview of key issues in linguistic structure at each level of representation. Authoritative yet concisely written, the volume will be of interest to scholars and students working in cognitive psychology, psycholinguistics, cognitive neuroscience, computer science, audiology and education and related fields. **Sign Language Research Sixty Years Later: Current and Future**

*Visible Variation* Pamela M. Perniss, Roland Pfau, Markus Steinbach, 2008-09-25 It has been argued that properties of the visual gestural modality impose a homogenizing effect on sign languages leading to less structural variation in sign language structure as compared to spoken language structure. However, until recently, research on sign languages was limited to a number of Western sign languages. Before we can truly answer the question of whether modality effects do indeed cause less structural variation, it is necessary to investigate the similarities and differences that exist between sign languages in more detail and especially to include in this investigation less studied sign languages. The current research climate is testimony to a surge of interest in the study of a geographically more diverse range of sign languages. The volume reflects that climate and brings together work by scholars engaging in comparative sign linguistics research. The 11 articles discuss data from many different signed and spoken languages and cover a wide range of topics from different areas of grammar including phonology, word pictures, morphology, pronouns, negation and auxiliaries, syntax, word order, interrogative clauses, auxiliaries, negation and referential shift and pragmatics, modal meaning and referential shift. In addition to this, the contributions address psycholinguistic issues, aspects of language change and issues concerning data collection in sign languages, thereby providing methodological guidelines for further research. Although some papers use a specific theoretical framework for analyzing the

data the volume clearly focuses on empirical and descriptive aspects of sign language variation      **Human Language** Peter Hagoort,2019-10-29 A unique overview of the human language faculty at all levels of organization Language is not only one of the most complex cognitive functions that we command it is also the aspect of the mind that makes us uniquely human Research suggests that the human brain exhibits a language readiness not found in the brains of other species This volume brings together contributions from a range of fields to examine humans language capacity from multiple perspectives analyzing it at genetic neurobiological psychological and linguistic levels In recent decades advances in computational modeling neuroimaging and genetic sequencing have made possible new approaches to the study of language and the contributors draw on these developments The book examines cognitive architectures investigating the functional organization of the major language skills learning and development trajectories summarizing the current understanding of the steps and neurocognitive mechanisms in language processing evolutionary and other preconditions for communication by means of natural language computational tools for modeling language cognitive neuroscientific methods that allow observations of the human brain in action including fMRI EEG MEG and others the neural infrastructure of language capacity the genome s role in building and maintaining the language ready brain and insights from studying such language relevant behaviors in nonhuman animals as birdsong and primate vocalization Section editors Christian F Beckmann Carel ten Cate Simon E Fisher Peter Hagoort Evan Kidd Stephen C Levinson James M McQueen Antje S Meyer David Poeppel Caroline F Rowland Constance Scharff Ivan Toni Willem Zuidema      *Encyclopedia of Language & Linguistics* E.
