Editorial on the Research Topic Neurological, neurophysiological, psychological and psychiatric effects of high altitude and hypoxia

Mental disorders show a prevalence of 30%–40% in the general population (Stoel *et al.*, 2014), and neurological symptoms such as headache or dizziness are among the most common presenting symptoms in emergency care. Despite their high prevalence, neurological symptoms outside of headache and high-altitude cerebral edema have only been investigated to a limited extent during hypoxia and high-altitude (HA) exposure (Wilcox *et al.*, 2009). HA can also affect higher cortical functions, leading to cognitive disturbances (Falla *et al.*, 2021). The effect of hypoxia and HA on the development of psychiatric symptoms is even less investigated (Hübner *et al.*, 2019). This contrasts sharply with the increasing number of individuals traveling to HA areas for leisure or occupational purposes and recent advances in the use of (intermittent) hypoxia as a treatment for various symptoms and conditions (Bartscher *et al.*, 2023).

The aim of the current Research Topic was to collect studies on the neurological, neurophysiological, psychological, and psychiatric effects of hypoxia and HA in order to advance research in the field and bring together researchers from different specialities involved in hypoxia and HA research. Within the Research Topic, we report the results of two controlled studies performed under laboratory conditions. Such studies performed in controlled environments help greatly to clarify our understanding of physiological and pathophysiological mechanisms at HA, since HA field studies are often performed under challenging conditions and thus often involve small sample sizes or confounding factors. Importantly, reporting guidelines for HA field studies have been established in recent years (Brodmann-Maeder *et al.*, 2018) and have proven useful when conducting and reporting research from HA field studies (Hübner *et al.*, 2021).
