THE SURFACE-PLATE AND SCRAPER

Object of the Surface-plate. — A skilled workman can machine a plane surface so nearly true that it will be difficult to detect any error in the surface with a straight-edge,* and the work will be sufficiently accurate for most practical requirements. Nevertheless there will be minute errors in the surface which make it unsatisfactory for some purposes. The sliding surfaces of machine-tools, for instance, require to be more accurate than it is possible to make them by machinery. For detecting the minute errors a surface-plate is used.

Description of the Surface-plate. — The surface-plate is a cast-iron plate having one surface machined and scraped to a practically perfect

FIG. 90.

plane. Fig. 90 shows two surface-plates of the usual form. In this design they are made in sizes varying between $3\frac{1}{2}'' \times 4''$ and $36'' \times 68''$, the largest weighing more than 1000 lbs.

A surface-plate of large size should be very carefully and intelligently designed. The metal should be so distributed as to require the least weight consistent with accuracy. The plate should also be so designed that it would not be distorted by variations in temperature. When not in use the plate should be oiled to prevent rusting and kept in a wooden case.
