Power Electronic Converters Guy Segulier, Francis Labrique, 2012-12-06 This is the final volume in a four volume series concerning POWER ELECTRONIC CONVERTERS The first volume studies AC DC conversion the second studies AC AC conversion and the third DC DC conversion This final volume deals with DC AC conversion i e with inverters At the output of an inverter fed by a DC voltage supply this voltage is alternatively found with one polarity and then with the other in other words an AC voltage made up of square pulses is obtained Filtering must be carried out if as is normally the case a virtually sinusoidal voltage is required this problem of filtering underlies the entire study of inverters In some applications the load itself provides the filtering In others a filter is installed between the inverter and the load however as it will be shown in Chap 2 in cases where the filtered voltage is at industrial network frequency and comprises only a single square wave pulse per half cycle the filter becomes bulky and costly and the results obtained are poor Filtering problems explain the considerable development of inverters during the last years Firstly there is increasing use of pulse width modulation each half cycle is cut up into several pulses of suitable widths this greatly simplifies filtering The use of a chopping frequency which is much greater than the frequency of the fundamental components of the inverter output voltage and current has only been made possible by progress in the field of semiconductor devices
