

Linear Algebra Primer

Daniel S. Stutts, Ph.D.

Original Edition: 12/1991 Current Edition: 4/1/04

1 Introduction

This primer was written to provide a brief overview of the main concepts and methods in elementary linear algebra. It was not intended to take the place of any of the many elementary linear algebra texts in the market. It contains relatively few examples and no exercises. The interested reader will find more in depth coverage of these topics in introductory text books. Much of the material including the order in which it is presented comes from Howard Anton's "Elementary Linear Algebra" 2nd Ed., John Wiley, 1977. Another excellent basic text is "Linear Algebra and Its Applications," by Charles G. Cullen. A more advanced text is "Linear Algebra and its Applications" by Gilbert Strang.

The author hopes that this primer will answer some of your questions as they arise, and provide some motivation (prime the pump, so to speak) for you to explore the subject in more depth. At the very least, you now have a list (albeit a short one) of references from which to obtain more in depth explanation.

It should be noted that the examples given here have been motivated by the solution of consistent systems of equations which have an equal number of unknowns and equations. Therefore, only the analysis of square (n by n) matrices have been presented. Furthermore, only the properties of real matrices (those with real elements) have been included.

1.1 Explanation of Notation Used

For clarity of notation, **bold** symbols are used to denote vectors and matrices. For matrices, upper case bold letters are used, and for vectors, which are $n \times 1$ matrices, bold lower case letters are used. Non-bold symbols are used to denote scalar quantities.

Subscripts are used to denote elements of matrices or vectors. Superscripts (when not referring to exponentiation) are used to identify eigenvectors and their respective components.

1.1.1 Indicical Notation

A matrix **A** may be described by *indicical* notation. The term located at the i^{th} row and j^{th} column is denoted by the scalar a_{ij} .

Thus, i_j^{th} component of the sum of two matrices, **A** and **B**, may be written: $[\mathbf{A} + \mathbf{B}]_{ij} = a_{ij} + b_{ij}$

Example 1

$$\mathbf{C} = \mathbf{A}_{(2 \times 2)} + \mathbf{B}_{(2 \times 2)} = \begin{bmatrix} (a_{11} + b_{11}) & (a_{12} + b_{12}) \\ (a_{21} + b_{21}) & (a_{22} + b_{22}) \end{bmatrix}$$

Hence, for example, $c_{12} = a_{12} + b_{12}$.
