4th - 10th Grade Reading Comprehension Passages & Questions Worksheet

Germ Theory of Disease

Reading Comprehension

1. The germ theory of disease states that many diseases are caused by microorganisms. These microorganisms, which are too small to be seen with the naked eye, can enter the body through the air, water, or food. Once inside the body, they can multiply and cause illness. This theory was first proposed by Louis Pasteur and Robert Koch in the 19th century.

2. Before the germ theory of disease, people believed that diseases were caused by bad air or an imbalance of the humors. This theory was based on the idea that the body had a natural balance of four humors: blood, phlegm, bile, and black bile. If this balance was disrupted, it was thought to cause disease.

3. The germ theory of disease was a major breakthrough in medicine. It led to the development of vaccines, antibiotics, and other treatments that have saved millions of lives. Today, we know that germs are responsible for many common diseases, such as the flu, pneumonia, and tuberculosis.

Immunity Theory

Reading Comprehension

1. The immunity theory states that the body has a natural defense system that can protect it from disease. This system is made up of white blood cells, which are able to recognize and destroy harmful microorganisms. This process is called the immune response.

2. There are two types of immunity: active and passive. Active immunity is developed when the body is exposed to a pathogen and produces its own antibodies. Passive immunity is developed when a person receives antibodies from another person, such as through a blood transfusion.

3. The immunity theory is important because it helps us understand how the body fights off disease. This knowledge has led to the development of vaccines, which are designed to stimulate the immune system and protect against specific diseases.

Endosymbiotic Theory

Reading Comprehension

1. The endosymbiotic theory states that certain organelles in eukaryotic cells, such as mitochondria and chloroplasts, were once free-living prokaryotes. These organelles entered a larger cell and formed a symbiotic relationship with it. Over time, they became integrated into the cell and lost their ability to live on their own.

2. This theory was first proposed by Lynn Margulis in the 1960s. She argued that mitochondria and chloroplasts have their own DNA, which is different from the DNA in the nucleus. This suggests that they were once separate organisms.

3. The endosymbiotic theory is supported by many pieces of evidence, including the fact that mitochondria and chloroplasts have their own DNA and reproduce independently of the cell. This theory is a key part of understanding the evolution of eukaryotic life.

Evolution Theory

Reading Comprehension

1. The evolution theory states that all living organisms are related and have evolved over time from a common ancestor. This process is driven by natural selection, which is the survival and reproduction of individuals with traits that are better suited to their environment.

2. Charles Darwin is the most famous proponent of the evolution theory. He proposed that species change over time through a process called natural selection. He argued that individuals with traits that are better suited to their environment are more likely to survive and reproduce, passing on those traits to their offspring.

3. The evolution theory is supported by many pieces of evidence, including the fossil record, comparative anatomy, and molecular biology. This theory is a fundamental part of modern biology and helps us understand the diversity of life on Earth.

Genetic Theory

Reading Comprehension

1. The genetic theory states that the traits of an organism are determined by genes. Genes are segments of DNA that contain the instructions for making proteins. These proteins then determine the organism's characteristics.

2. Gregor Mendel is the father of genetics. He conducted experiments with pea plants and discovered the basic principles of inheritance. He found that traits are passed on from parents to offspring in a predictable way.

3. The genetic theory is important because it helps us understand how traits are passed on and how they can change over time. This knowledge has led to many advances in medicine and agriculture.

Molecular Genetics Theory

Reading Comprehension

1. The molecular genetics theory states that the structure and function of DNA are the basis for the inheritance of traits. DNA is a double helix structure made up of two strands of sugar and phosphate groups, with nitrogenous bases in the middle.

2. The molecular genetics theory was developed in the 1940s and 1950s. It was based on the work of James Watson and Francis Crick, who discovered the structure of DNA. This theory explains how genetic information is stored and passed on.

3. The molecular genetics theory is important because it helps us understand the molecular basis of inheritance and how mutations can lead to disease. This knowledge has led to many advances in medicine and biotechnology.

Chromosome Theory

Reading Comprehension

1. The chromosome theory states that chromosomes are the carriers of genetic information. Chromosomes are made up of DNA and proteins. They are found in the nucleus of a cell and are responsible for the inheritance of traits.

2. The chromosome theory was developed in the early 1900s. It was based on the work of Walter Sutton and Theodor Boveri, who discovered that chromosomes behave in a way that is similar to Mendel's laws of inheritance.

3. The chromosome theory is important because it helps us understand how genetic information is organized and passed on. This knowledge has led to many advances in genetics and medicine.
