Numerical Solutions of Boundary Value Problems for Ordinary Differential Equations A.K. Aziz, 2014-05-10 Numerical Solutions of Boundary Value Problems for Ordinary Differential Equations covers the proceedings of the 1974 Symposium by the same title held at the University of Maryland Baltimore Country Campus This symposium aims to bring together a number of numerical analysis involved in research in both theoretical and practical aspects of this field This text is organized into three parts encompassing 15 chapters Part I reviews the initial and boundary value problems Part II explores a large number of important results of both theoretical and practical nature of the field including discussions of the smooth and local interpolant with small K th derivative the occurrence and solution of boundary value reaction systems the posteriori error estimates and boundary problem solvers for first order systems based on deferred corrections Part III highlights the practical applications of the boundary value problems specifically a high order finite difference method for the solution of two point boundary value problems on a uniform mesh This book will prove useful to mathematicians engineers and physicists

Numerical Methods for Stiff Two-Point Boundary Value Problems H. Kreiss, N. K. Nichols, D. L. Brown, WISCONSIN UNIV-MADISON MATHEMATICS RESEARCH CENTER., 1983 The authors consider the two point boundary value problem for stiff systems of ordinary differential equations For systems that can be transformed to essentially diagonally dominant form with appropriate smoothness conditions a priori estimates are obtained Problems with turning points can be treated with this theory and we discuss this in detail They give robust difference approximations and present error estimates for these schemes In particular they give a detailed description of how to transform a general system to essentially diagonally dominant form and then stretch the independent variable so that the system will satisfy the correct smoothness conditions Numerical examples are presented for both linear and nonlinear problems Author On the Numerical Solution of Two-point Boundary Value Problems II. P. Starr, YALE UNIV NEW HAVEN CT Dept. of COMPUTER SCIENCE., 1990 In a recent paper Greengard and Rokhlin introduce a numerical technique for the rapid solution of integral equations resulting from linear two point boundary value problems for second order ordinary differential equations In this paper we extend the method to systems of ordinary differential equations After reducing the system of differential equations to a system of second kind integral equations we discretize the latter via a high order Nystrom scheme A somewhat involved analytical apparatus is then constructed which allows for the solution of the discrete system using $O(N^2 p^2 n^3)$ operations with N the number of nodes on the interval p the desired order of convergence and n the number of equations in the system Thus the advantages of the integral equation formulation small condition number insensitivity to boundary layers insensitivity to end point singularities etc are retained while achieving a computational efficiency previously available only to finite difference of finite element methods We in addition present a Newton method for solving boundary value problems for nonlinear first order systems in which each Newton iterate is the solution of a second kind integral equation the analytical and numerical advantages of integral equations are thus obtained for nonlinear boundary value problems kr *Numerical Boundary Value ODEs* Ascher, Russell, 2012-12-06 In the past few years knowledge about methods for the numerical solution of two point boundary value problems has increased significantly Important theoretical and practical advances have been made in a number of fronts although they are not adequately described in any text currently available With this in mind we organized an international workshop devoted solely to this topic The workshop took place in Vancouver B C Canada in July 13 1984 This volume contains the refereed proceedings of the workshop Contributions to the workshop were in two formats There were a small number of invited talks ten of which are presented in this proceedings the other contributions were in the form of poster sessions for which there was no parallel activity in the workshop We had attempted to cover a number of topics and objectives in the talks As a result the general review papers of O Malley and Russell are intended to take a broader perspective while the other papers are more specific The contributions in this volume are divided somewhat arbitrarily into five groups The first group concerns fundamental issues like conditioning and decoupling which have only recently gained a

proper appreciation of their centrality Understanding of certain aspects or shooting methods ties in with these fundamental concepts The papers of Russell dt Hoog and Mattheij all deal with these issues
