Numerical Solution Of Initial Value Prob:

Numerical Solution of Initial-value Problems in Differential-algebraic Equations K. E. Brenan, S. L. Campbell, L. R. Petzold, 1996-01-01 Many physical problems are most naturally described by systems of differential and algebraic equations. This book describes some of the places where differential algebraic equations (DAEs) occur. The basic mathematical theory for these equations is developed and numerical methods are presented and analyzed. Examples drawn from a variety of applications are used to motivate and illustrate the concepts and techniques. This classic edition, originally published in 1989, is the only general DAE book available. It not only develops guidelines for choosing different numerical methods, it is the first book to discuss DAE codes including the popular DASSL code. An extensive discussion of backward differentiation formulas details why they have emerged as the most popular and best understood class of linear multistep methods for general DAEs. New to this edition is a chapter that brings the discussion of DAE software up to date. The objective of this monograph is to advance and consolidate the existing research results for the numerical solution of DAEs. The authors present results on the analysis of numerical methods and also show how these results are relevant for the solution of problems from applications. They develop guidelines for problem formulation and effective use of the available mathematical software and provide extensive references for further study.

Numerical Methods for Ordinary Differential Equations David F. Griffiths, Desmond J. Higham, 2010-11-11 *Numerical Methods for Ordinary Differential Equations* is a self-contained introduction to a fundamental field of numerical analysis and scientific computation. Written for undergraduate students with a mathematical background, this book focuses on the analysis of numerical methods without losing sight of the practical nature of the subject. It covers the topics traditionally treated in a first course but also highlights new and emerging themes. Chapters are broken down into lecture-sized pieces, motivated and illustrated by numerous theoretical and computational examples. Over 200 exercises are provided, and these are starred according to their degree of difficulty. Solutions to all exercises are available to authorized instructors. The book covers key foundation topics: Taylor series methods, Runge-Kutta methods, linear multistep methods, convergence, stability, and a range of modern themes: adaptive stepsize selection, long-term dynamics, modified equations, geometric integration, stochastic differential equations. The prerequisite of a basic university-level calculus class is assumed, although appropriate background results are also summarized in appendices. A dedicated website for the book containing extra information can be found via www.springer.com.
