

3 Configuration Set Management: GDE

One of the ways to manage the configuration sets is by using the GDE tool. To have all the necessary access rights to change the relevant parameters, a GDE tool with OEM Engineering license is required.

This OEM Engineering level GDE tool allows the user to access and change the parameters described above.

An OEM engineer can prepare the different configuration sets in accordance to the different machines that are being produced.

Once this is performed (for a certain type of drive train, being engine and transmission), this information is saved to a specific file that will be programmed into the APC200 controllers for machines with that drive train.

All information for the different configuration sets as defined by OEM engineering are downloaded into the flash memory of the APC200 controller. That way a desired machine configuration can easily be selected in the production line or at an OEM service centre without having to configure a long list of parameters.

This will be possible by using a GDE with a different access level, being OEM Production.

3.1 Editing Configuration Sets with OEM Engineering GDE

When connected to an APC200, using the GDE tool you can access the existing configuration settings in that controller by performing an upload.

Normally these configuration sets would be prepared in an office environment where there is not always a setup with a connected APC200 available. In that case you just open an existing file that has been saved by you earlier or that you have received from DANA.

Selecting the Header "ConfSets" presents the table where all configurations are available for editing.
