**Research Directions in Parallel Functional Programming** Kevin Hammond, Greg Michaelson, 2012-12-06 Programming is hard Building a large program is like constructing a steam locomotive through a hole the size of a postage stamp An artefact that is the fruit of hundreds of person years is only ever seen by anyone through a 100 line window In some ways it is astonishing that such large systems work at all But parallel programming is much much harder There are so many more things to go wrong Debugging is a nightmare A bug that shows up on one run may never happen when you are looking for it but unfailingly returns as soon as your attention moves elsewhere A large fraction of the program's code can be made up of marshalling and coordination algorithms The core application can easily be obscured by a maze of plumbing Functional programming is a radical elegant high level attack on the programming problem Radical because it dramatically eschews side effects elegant because of its close connection with mathematics high level because you can say a lot in one line But functional programming is definitely not yet mainstream That's the trouble with radical approaches it's hard for them to break through and become mainstream But that doesn't make functional programming any less fun and it has turned out to be a wonderful laboratory for rich type systems automatic garbage collection object models and other stuff that has made the jump into the mainstream , *Research Directions in Parallel Functional Programming* Kevin Hammond, 1999-11 This volume provides a state of the art survey of research trends in parallel functional programming The text is divided into two sections the first section gives comprehensive introductions to key issues such as foundations programming constructs proof architectures and implementations the second comprises shorter summaries of research areas which are either of particular interest at the moment or which promise to provide key developments in the near future Topics covered here include coordination languages performance monitoring data flow programming explicit parallelism BSP and cost modelling Contributions have

been commissioned by key researchers and practitioners in the area including several from the US and Canada where this is an area of increasing interest Research Directions in Parallel Functional Programming will be of interest to researchers post graduate students and practitioners in all relevant areas

**Communicating Process Architectures 2000** World Occam and Transputer User Group. Technical Meeting, 2000 Modern computing systems are built in terms of components and those components communicating Communication systems imply concurrency which is a theme of the WoTUG series Traditionally concurrency has been taught considered and experienced as an advanced and difficult topic The thesis underlying this conference is that that idea is wrong The natural world operates through continuous interaction of massive numbers of autonomous agents at all levels sub atomic human astronomic It seems it is time to mature concurrency into a core engineering discipline that can be used on an everyday basis to simplify problem solutions as well as to enable them The goal of Communicating Process Architectures 2000 was to stimulate discussion and ideas as to the role concurrency should play in future generations of scalable computer infrastructure and applications where scaling means the ability to ramp up functionality stay in control as complexitiy increases as well as physical metrics such as performance
