Students' Development of Models of Magnetic Materials, Patterns of Group Activity, and Social Norms in a Physics Classroom Andrew P. Johnson, 1999 This dissertation is a study of students model development processes in a physical science course for preservice elementary teachers It details the models of magnetic materials developed and used by students during a unit on static electricity and magnetism In this inquiry based course the class developed and formally accepted a model in the form of diagrams and descriptions that is very similar to the accepted magnetic domains model They did this without textbooks or lectures on magnetism Before adopting this model however most groups in the class temporarily used models involving opposite charges at the two ends of magnetized nails How did the students do it The explanation involves detailed study of the groups interactions and use of structure in the classroom environment This dissertation uses two theoretical frameworks to analyze interactions It applies Yackel and Cobb s 1996 concepts of classroom social norms to characterize aspects of the classroom participation structure which affected groups construction and

declaration of models It also applies distributed cognition ideas to analyze the sense making conversations that small groups had when constructing group responses This research found that conversations in one small group could be characterized into sixteen categories Important categories included extending ideas which involved gradual deepening and elaboration of the group s understanding of their model s and joint typing an interactive process by which group members collaborated on typed statements or group diagrams and simultaneously developed common language for communicating their ideas to each other Some of these categories of activity were closely connected to computer use Also four classroom norms are described One small group social classroom norm involved group members developing a common ground consisting of agreed upon group statements Three sociophysics norms which characterize the whole class interactions as well as those of the small group involved a distinction between generalizations of phenomena and theoretical statements class criteria for accepting evidence and the obligation for each group to have a model of magnetic materials that they could support with acceptable evidence
