### **OBJECT ORIENTED ANALYSIS: USE-CASE DRIVEN**

Analysis is the process of extracting the needs of a system and what the system must do to satisfy the users' requirement.

The goal of object oriented analysis is to understand the domain of the problem and the system's responsibilities by understanding how the users use or will use the system.

The first step in finding an appropriate solution to a given problem is to understand the problem and its domain.

The main objective of the analysis is to capture a complete, unambiguous, and consistent picture of the requirements of the system and what the system must do to satisfy the users' requirements and needs.

This is accomplished by constructing several models of the system that concentrate on describing what the system does rather than how it does it. Separating the behavior of a system from the way that behavior is implemented requires viewing the system from the perspective of the user rather than that of the machine.

Analysis is the process of transforming a problem definition from a fuzzy set of facts and myths into a coherent statement of a system's requirements.

#### **3.1 WHY ANALYSIS IS A DIFFICULT ACTIVITY**

Analysis is a creative activity that involves understanding the problem, its associated constraints, and methods of overcoming those constraints. This is an iterative process that goes on until the problem is well understood. Norman explains the three most common sources of requirement difficulties:

**1. Fuzzy descriptions** - such as "fast response time" or "very easy and very secure updating mechanisms." A requirement such as fast response time is open to interpretation, which might lead to user dissatisfaction if the user's interpretation of a fast response is different from the systems analyst's interpretation.

**2. Incomplete requirements** - mean that certain requirements necessary for successful system development are not included for a variety of reasons. These reasons could include the users' forgetting to identify them, high cost, politics within the business, or oversight by the system developer. However, because of the iterative nature of object-oriented analysis and the unified approach most of the incomplete requirements can be identified in subsequent tries.

**3. Unnecessary features** - When addressing features of the system, keep in mind that every additional feature could affect the performance, complexity, stability, maintenance, and support costs of an application. Features implemented by a small extension to the application code do not necessarily have a proportionally small effect on
