Human Circulation Loring B. Rowell, 1986 Here is the first single volume work to analyze in a comprehensive manner the mechanisms by which the human cardiovascular

system adjusts to physical stresses such as exercise heat upright posture and hypoxia Emphasizing the regulation of regional blood flow and blood volume the work delineates the unique character of the human cardiovascular system and the regulatory problems it faces It represents a timely response to the growing interest in cardiovascular health exercise and physical conditioning In describing the basic mechanisms of vasomotor control the author focuses on the interaction between the arterial and venous systems He indicates how control of regional circulations interacts with control of venous volume and cardiac performance showing how vasomotor and venomotor regulation serves the entire organism This treatment redresses an imbalance in contemporary teaching of cardiovascular physiology which has focused more on the heart than on the vasculature The book utilizes graphics imaginatively throughout to clarify concepts in a fresh and effective way Features Analytical quantitative and problem oriented Uniquely comprehensive coverage extends from small blood vessel functioning to the entire system Imaginatively illustrated with exceptionally clear graphics that explain basic principles and controversial ideas Original new ideas on how peripheral circulation influences heart performance Probes the upper limits of human cardiovascular function their causes and how they change *Neurotransmitters and the Cerebral Circulation* E.
