**Neural Networks and the Financial Markets** Jimmy Shadbolt, 2002-08-06 This is a book about the methods developed by our research team over a period of 10 years for predicting financial market returns The work began in late 1991 at a time when one of us Jimmy Shadbolt had just completed a rewrite of the software used at Econostat by the economics team for medium term trend prediction of economic indicators Looking for a new project it was suggested that we look at non linear modelling of financial markets and that a good place to start might be with neural networks One small caveat should be added before we start we use the terms prediction and prediction model throughout the book although with only such a small amount of information being extracted about future performance can we really claim to be building predictors at all Some might say that the future of markets especially one month ahead is too dim to perceive We think we can claim to predict for two reasons Firstly we do indeed predict a few per cent of future values of certain assets in terms of past values of certain indicators as shown by our track record Secondly we use standard and in house prediction methods that are purely quantitative We allow no subjective view to alter what the models tell us Thus we are doing prediction even if the problem is very hard So while we could throughout the book talk about getting a better view of the future or some such euphemism we would not be correctly describing what it is we are actually doing We are indeed getting a better view of the future by using prediction methods

**Forecasting Financial Markets Using Neural Networks** Jason E. Kutsurelis, 1998 This research examines and analyzes the use of neural networks as a forecasting tool Specifically a neural network's ability to predict future trends of Stock Market Indices is tested Accuracy is compared against a traditional forecasting method multiple linear regression analysis Finally the probability of the model's forecast being correct is calculated using conditional probabilities While only briefly discussing neural network theory this research determines the feasibility and practicality of using neural networks as a forecasting tool for the individual investor This study builds upon the work done by Edward Gately in his book *Neural Networks for Financial Forecasting* This research validates

the work of Gately and describes the development of a neural network that achieved a 93.3 percent probability of predicting a market rise and an 88.07 percent probability of predicting a market drop in the S P500. It was concluded that neural networks do have the capability to forecast financial markets and if properly trained the individual investor could benefit from the use of this forecasting tool. *AI 2003: Advances in Artificial Intelligence* Tamas D. Gedeon, Lance C.C. Fung, 2003-12-01

Consider the problem of a robot algorithm learning mechanism moving along the real line attempting to locate a particular point. To assist the mechanism we assume that it can communicate with an Environment Oracle which guides it with information regarding the direction in which it should go. If the Environment is deterministic the problem is the Deterministic Point Location Problem which has been studied rather thoroughly. In its pioneering version the problem was presented in the setting that the Environment could charge the robot a cost which was proportional to the distance it was from the point sought for. The question of having multiple communicating robots locate a point on the line has also been studied. In the stochastic version of this problem we consider the scenario when the learning mechanism attempts to locate a point in an interval with stochastic i.e. possibly erroneous instead of deterministic responses from the environment. Thus when it should really be moving to the right it may be advised to move to the left and vice versa. Apart from the problem being of importance in its own right the stochastic point location problem also has potential applications in solving optimization problems. In many optimization solutions for example in image processing pattern recognition and neural computing. The algorithm works its way from its current solution to the optimal solution based on information that it currently has. A crucial question is one of determining the parameter which the optimization algorithm should use. *Journal of Banking & Finance*, 1994
