**Applying Mobile Code to Distributed Systems** David A. Halls,1997 Abstract Use of mobile code can make distributed systems and the abstractions they provide more flexible to build and use Richer functionality can be given to the interaction between processes by allowing code to be sent between them More convenient application level operations can be made over a network By making higher order language features transmissible distributed components can be tightly bound together when they communicate At the same time familiar distributed systems can be built using mobile code Mobile code can make distributed systems adaptable to application needs Rather than fixing the interface to a resource and the pattern of interaction with it a minimal interface can be defined and code implementing higher level interfaces placed alongside it as and when required These higher level interfaces can be application specific allowing for interaction patterns

that were unknown at the time the resource was made available Sending code close to a resource can also reduce network usage because the point of interaction with it moves The combination of document markup supporting hypertext and a language supporting state saving allows for stateful client server sessions with stateless servers and lightweight clients Putting dormant mobile code in documents provides an alternative to holding knowledge of application functionality on a server machine or running arbitrary code on a client machine Mobile code helps to support user mobility Personalised environments that support state saving can follow a user between computers Heterogeneous state saving allows a user's programs to be relocated between computers By using a mobile code system with language support for state saving applications can direct arbitrary component migration without priming program servers with specific support In summary this dissertation supports the thesis that mobile code can be used to enhance distributed systems
