Translational Control of Gene Expression Nahum Sonenberg,John W. B. Hershey,Michael B. Mathews,2000 Since the 1996 publication of Translational Control there has been fresh interest in protein synthesis and recognition of the key role of translation control mechanisms in regulating gene expression This new monograph updates and expands the scope of the earlier book but it also takes a fresh look at the field In a new format the first eight chapters provide broad overviews while each of the additional twenty eight has a focus on a research topic of more specific interest The result is a thoroughly up to date account of initiation elongation and termination of translation control mechanisms in development in response to extracellular stimuli and the effects on the translation machinery of virus infection and disease This book is essential reading for students entering the field and an invaluable resource for investigators of gene expression and its control Peterson's Guide to Graduate Programs in the Biological and Agricultural Sciences,1990 Proceedings of the National Academy of Sciences of the United States of America National Academy of Sciences (U.S.),2007

**Computational Analysis of the Interplay Between RNA Structure and Function** Elan A. Shatoff, 2021 RNA is ubiquitous in the cellular environment and it can function in innumerable ways with a variety of interaction partners A RNA molecule s structure in particular the set of base pairing interactions between the nucleotides of the molecule known as secondary structure can help determine its function Since most proteins can only bind to either single stranded or double stranded RNA RNA secondary structure can also help determine where and how RNA protein binding interactions occur In this work I investigate computational models for RNA protein interactions in a variety of different contexts In Chapter 2 I probe the effect of single nucleotide variations on RNA protein binding as mediated by RNA secondary structure Single nucleotide variations are single nucleotide changes in an organism s genome that can often cause disease and may do so through a number of different mechanisms In this work we propose that sequence changes can affect accessibility to protein binding sites through changes in secondary structure even when these sequence changes occur tens of nucleotides outside of protein binding sites We find that single nucleotide

variations can have a many fold effect on the binding affinity of proteins for RNA and characterize the genome wide effect of single nucleotide variations on HuR binding HuR is a single stranded RNA binding protein that binds to AU rich sequences and has links to diseases such as cancer We also find an asymmetry in this effect for HuR indicating that this effect may be under selection Following the previous work which utilizes a model incorporating single stranded RNA binding proteins into RNA secondary structure folding I introduce a model for incorporating double stranded RNA binding proteins dsRBPs into RNA secondary structure partition function calculations in Chapter 3 The dsRBPs are an important but understudied class of proteins that have uses in a wide range of processes We implement our model in the ViennaRNA package and validate it by calculating a number of experimental observables for transactivation response element RNA binding protein We find that RNA secondary structure can have a many fold effect on the effective binding affinity of dsRBPs and show that calculated affinities for pre miRNA like constructs correlate with experimentally measured processing rates Our model provides a novel method for interrogating the interplay between dsRBPs and RNA secondary structure In Chapter 4 I study RNA protein interactions in a different context and investigate the role of Shine Dalgarno SD sequences in translation in the Bacteroidetes The Bacteroidetes are a phylum of bacteria known to rarely use SD sequences but after performing a survey of SD usage in the phylum we find that certain ribosomal protein genes utilize them particularly rpsU A cryo electron microscopy structure of the ribosome from *Flavobacterium johnsoniae* a member of the Bacteroidetes also shows that S21 which is encoded by the ribosomal open reading frame rpsU sequesters the anti Shine Dalgarno ASD sequence In our survey of SD sequences we also find covariation between the SD sequence of rpsU and the ASD sequence These observations suggest an autoregulatory model for S21 in the Bacteroidetes
