Methods for calculating the optical properties as a function of wavelength for second-order nonlinear optical polymers are presented. By combining the optical properties of the individual components, that is, those of the polymer and those of the chromophore, one can determine the real and the imaginary parts of the index of refraction and the second hyperpolarizability as a function of wavelength for a composite polymer, for either a guest-host or a side-chain system. These properties are important for characterizing and applying nonlinear optical polymers to devices. The methods allow for an accuracy in index of 3%, if the wavelength range includes the main absorption band (with absorption maximum at λ_{max}) of the chromophore, and of 0.2% for wavelengths 400 nm and more to the long-wavelength side of λ_{max} . In addition, if the index of the composite polymer is known at one specific wavelength on the long-wavelength side of λ_{max} , the dispersion in the index in this wavelength range can be predicted to within 0.1%. © 1998 Optical Society of America.

1. INTRODUCTION

Second-order nonlinear optical (NLO) polymers are organic polymeric molecules to which a NLO chromophore is either added as a guest or chemically attached in the main chain or as a pendant side chain. These chromophores are designed and synthesized to produce large second-order optical nonlinearities and to have thermal stability for application in optoelectronic devices. Clearly, if one has prepared a NLO polymeric film of good optical quality, then it is obvious that one would measure the index, absorption, and hyperpolarizability directly. However, to synthesize many different chromophores, substitute them into polymers, and cast them into thin films for their characterization is expensive and time consuming. One would, therefore, like to predict the optical properties when designing NLO devices without involved chemistry, film formation, and various methods of characterization. We outline procedures that show convenient and accurate ways to do this calculation.

The overall second-order nonlinearity $\chi^{(2)}$ depends on the molecular first-order hyperpolarizability β , the extent of orientation ($\cos^2 \theta$), the concentration of the chromophore in the polymer, and local electric-field factors. Although the concentration is usually low (~20%), its presence makes a significant contribution to the optical properties of the composite system. A number of these NLO chromophores have been studied, their β values and wavelengths of maximum absorption, λ_{max} , have been tabulated,¹⁻⁴ and several second-order NLO polymers have been reviewed by Miller.⁵

In this paper we show that, by knowing the properties of the individual components (dye, neat polymer), one can

usually determine combinations with good accuracy. For the neat polymer the relationship between the index and the wavelength is given by a Sellmeier equation. To calculate the index of the dye from its absorption bands, both the Lorentz equation and a conjugate Fourier series method are used. For calculating the composite index, an effective-index method is described. After this treatment of the linear properties, the dispersion of the nonlinear properties is presented.

2. EFFECTIVE-INDEX APPROACH

The Lorentz-Lorentz equation relates the index of refraction to the polarizability of the molecule. This is the optical analog of the Clausius-Mossotti equation,⁶ which relates the low-frequency dielectric function to the polarizability:

$$\frac{n^2 - 1}{n^2 + 2} = \frac{4\pi}{3} N\alpha. \quad (1)$$

Here α is the microscopic polarizability, n is the index of refraction, and N is the number of molecules per unit volume and is equal to A_p/M , that is, Avogadro's number times the density, divided by the molecular weight. Our goal is to determine the composite index of a polymer-chromophore system. Depending on the concentration of chromophores in the polymer, we assign the proper number of repeat units of the polymer, that is, an oligomer consisting of the set of repeat units and one molecule of the chromophore. Then, in a unit volume, the number of chromophores, the number of oligomers without chromophore, and the number of oligomers including the chromophore are all the same. Consequently the effective po-
